Metrics Spec 1.0.0

Aggregated metrics for banks and insurers

Status: release for implementation feedback · published 2026-10-11 · validation parameters 1.0.0

1. Purpose, audience and versioning

2. General data rules

3. Capability levels

4. Product taxonomy

5. Metrics per category

6. Validation parameters

7. Standard dimensions

8. Breaks and events

9. Conformance checks and errors

10. Open points and assumptions

11. Event themes each category helps check

12. Counts

13. Common misreadings

Change log

This spec tells a bank or an insurer **which aggregated numbers to expose, per product category**. For each number it gives:

- what goes in it and what stays out;
- which date each record is booked on, and how to convert currency;
- how to serve it over HTTP.

It works in any country. It names no regulator, calendar, currency or geography as a requirement.

The checks that use the data look for real changes over time, so every number has to be:

- **comparable over time**;
- **safe to share in aggregate**;
- **precise enough that two institutions compute the same value from the same records**.

1. Purpose, audience and versioning

1.1 What the data is for

A monitoring system watches market and news events: currency moves, rate changes, disasters, regulation, competitor news. From each event it forms hypotheses about how an institution's products could be hit, for example "SME importers will open fewer letters of credit". It then checks each hypothesis against the institution's own aggregated data. The checks are code (statistical tests over time windows), and they answer three questions:

- Is the change real?
- How big is it compared with normal seasonality?
- Is it still developing?

The checks run **inside the institution** (on its premises or in its own cloud). Only verdicts, and the aggregates behind them, leave it.

1.2 Who this is for

Reader	Uses
Data and IT teams at banks and insurers	§2 rules, §5 definitions, §7 dimensions, §8 breaks, §9 checks, the OpenAPI file
Product, risk and finance owners	§4 taxonomy, the "question" of each metric in §5, §3 levels
The onboarding connector	the YAML and the OpenAPI file: it checks that the institution's API implements the reference API, test-calls the endpoints and reports coverage and fixes
The checking system	§6 validation parameters (owned by the checks, not served by institutions)

1.3 How institutions use it

- You keep your own systems, and put an API in front of them that implements the **reference API** (`metrics-spec-v1.0-openapi.yaml`): its paths, parameters, fields, metric keys and dimension values. This is the only way to connect; there is no per-institution mapping.
- At onboarding, the connector reads your OpenAPI document, checks that it is the reference API (same MAJOR version), test-calls it with the conformance checks (§9) and reports coverage and fixes. A person on your side approves the connection.
- **A coarser grain is accepted at reduced capability.** A daily metric served weekly still counts as served, but the checks that need days timing (`recent_vs_prior`) are off for it, and the coverage report says so.
- Start with the **starter set** (R8): about a dozen metrics that most institutions can serve in days. Then add the required metrics of each category you offer.

1.4 Versioning

The spec uses semantic versioning, `MAJOR.MINOR.PATCH` .

Change	Bump
Removing a metric, a dimension or a dimension value; changing a definition so that the same records give a different number; changing a metric's kind, unit, currency rule or grain; making an optional API field or parameter required; renaming without an alias	**MAJOR**
Adding a category, metric, dimension, dimension value, optional field or alias; moving a metric between `optional` and `recommended` ; promoting a metric to `required` (takes effect 12 months after publication)	**MINOR**
Wording, examples and typos that change no number	**PATCH**

Deprecation and aliases.

- A metric is never deleted silently. It is first marked `deprecated_in: <version>` with `replaced_by` , and it stays valid for at least 12 months and until the next MAJOR.
- Renamed keys, dimension keys and dimension values keep their old names as **structured aliases** for the whole MAJOR line. Each alias says `old → new` . It may add a filter: if a later version folded a metric `x` into `y` with `source=z` , the alias `x` would mean `y` filtered to `source=z` . It may also be a **context alias** that points to a different metric shown as context. Version 1.0 has no aliases yet.
- An alias's filter is added to the request's filter. A request that sets the same dimension to a different value gets `alias_filter_conflict` .
- `GET /catalog` lists the aliases and deprecations the server honours.

Validation parameters are versioned separately (`validation_params_version`). They belong to the checking system, which recalibrates them from placebo runs. Changing them never changes the spec version and never asks anything of an institution.

Declaring what you implement. The institution profile below is returned by `GET /metrics/v1/catalog` , or served by every conforming API. Every response also carries the header `Metrics-Spec-Version: 1.0.0` . The checks accept any version with the same MAJOR.

Profile field	Required	What to give	Examples
`institution_type`	yes	`bank` or `insurer` ; **one profile per reporting entity and country**	a group with a bank and a takaful subsidiary registers two profiles

Profile field	Required	What to give	Examples
`spec_version`	yes	the version implemented	`1.0.0`
`time_zone`	yes	an IANA name; every date in every response is a local date in this zone	`Asia/Riyadh`, `Europe/Berlin`, `America/Sao_Paulo`, `Africa/Lagos`
`business_calendars`	yes	one **primary** calendar, plus one for every region whose holidays or weekend differ; each gives weekend days (ISO weekday numbers), the region_l1 values it covers, and its source (served at `GET /calendar?calendar_id=`, or a named public calendar)	India: a primary calendar plus state calendars for state bank holidays; Malaysia: Kedah, Kelantan and Terengganu on a Friday-Saturday weekend
`base_currency`	yes	ISO 4217 code of the reporting currency	`SAR`, `EUR`, `BRL`, `LKR`
`base_currency_history`	if any	earlier base currencies, with the redenomination date and legal factor	Sierra Leone: `SLL` until 2022-07-01, factor 1,000
`pivot_currency`	yes	ISO 4217 code used to total original-currency metrics across currencies (default `USD`)	`USD`; `EUR` for a euro-area bank
`fx_reference_sources`	yes	per use (default, trade, remittance, card…): the source, rate type (mid) and fixing time of the daily rates used for conversion	a central bank's daily reference rate; ECB euro reference rates; in a multiple-rate regime, the official rate for trade and the declared market rate for remittances
`inflation_regime`	yes	`normal`, or `high` (hyperinflationary under IAS 29, or annual CPI inflation above 25%)	Argentina, Türkiye: `high`
`region_basis`	banks	`home_branch` (default) or `customer_domicile`; **branchless institutions must use `customer_domicile`**	
`region_levels`	yes	how region_l1 and region_l2 are coded (ISO 3166-2, or mapped national codes)	
`sector_classification`	yes	ISIC Rev.4, or the classification mapped to it	NACE Rev.2, NAICS 2022
`accounting_framework`	yes	IFRS 9 / IFRS 17, AAOIFI, US GAAP (CECL) or local GAAP, plus `dpd_materiality` (default none), `dpd_reset_on_restructure` (normally false) and a note on how local arrears buckets map to days past due	
`suppression`	yes	minimum contributors (default 10) and dominance limits (default one above 50%, two above 85%); a stricter local rule if any	
`renewal_grace_days`, `free_look_days`	insurers	grace period before renewals are measured, and free-look period (defaults 30 and 30)	
`capability_level`	yes	L1-L5 (§3): the lowest level across your required metrics; metrics may declare their own	
`vintages_kept`, `vintage_history_from`	yes	whether you serve vintages (L4), and from which date they are true or reconstructed	
`segment_snapshot`	no	how `segment_as_of` is honoured: dated attribute history, weekly snapshots, or static	
`shariah_compliant`	no	true for an Islamic bank or a takaful operator (products also carry the flag)	

2. General data rules

These rules apply to every metric. Each comes with an example that complies and a counter-example that doesn't.

R1. Aggregates only

Serve totals, counts and ratios over groups of customers. Never serve:

- personal data;
- account, card or policy numbers;
- names, or identifiers of single customers, employers or obligors;
- a single customer's amounts.

You suppress small or dominated aggregates yourself. A suppressed row returns value, numerator, denominator, exposure and volume as `null`, with `suppressed: true` and a `suppression_reason`. The full rule:

Rule	What it says
contributors	Suppression counts distinct contributors (customers, obligors, policyholders, merchants), not accounts or transactions. A cell needs at least min_contributors contributors (default 10).
dominance	A cell is suppressed when one contributor holds more than 50% of the measured component, or the two largest together hold more than 85% (the (1, 50%) and (2, 85%) dominance rules). A stricter local rule wins.
measured component	**flow, count, stock:** the value **net flow:** each gross side (credits and debits) separately **ratio:** the denominator, and the numerator when it is above zero; if only the numerator is dominated, value and numerator are suppressed and the row says suppression_reason: numerator_dominance **rate:** the numerator (events) and the exposure **level (index, median):** medians are served only with at least 20 contributors, as the mean of the 4 central values, rounded to 2 significant figures; indices only from at least 20 priced items
filters	A request filters on at most 3 dimensions. The catalog may restrict the combinations it serves (filter_sets). Complementary suppression is computed over every combination the institution serves: no suppressed cell may be derivable from published cells by addition or subtraction.
vintages	A revision is released only when the change from the last released vintage, taken as its own aggregate, passes the contributor and dominance rules; until then the earlier value stays served with revision_held: true. Held revisions are released, accumulated, once they pass or when the period reaches its stable age.
segment dates	segment_as_of must be a Monday (an ISO-week start). A segment_as_of is refused for a cell (suppression_reason: segment_difference) when the number of customers whose membership differs from the previous Monday's is between 1 and min_contributors - 1.
change concentration	Windows a and b are disjoint, each a whole number of grid periods, of equal length, with b after a. The response gives only a band of the top share; no change value. Both windows need at least min_contributors contributors.
free text	Break descriptions, notes and declarations never name customers, employers or obligors.
audit	Every query is logged. The institution reviews repeated near-identical queries (differencing patterns).

Why these rules:

- **(2, 85%) dominance.** With two contributors at 45% each, the (1, 50%) rule alone lets each one subtract its own amount and learn the other's.
- **Disjoint, equal windows and bands in change-concentration.** Without them, nested windows turn the endpoint's answer into a single day's value. A share multiplied by a change multiplied by a denominator is one obligor's drawdown.
- **The revision and segment-date guards.** They close the two remaining ways of differencing: comparing vintages, and comparing segment dates.

> **Example.** A Brazilian bank serves `facility_utilization` for `size_band=corporate, sector=C` in a week: 41 obligors, the largest at 9% and the two largest at 16% of limits, value 61.2%, numerator BRL 3.1bn, denominator BRL 5.065bn.

>

> **Counter-example.** The same bank serves a cell of 11 obligors where two hold 48% and 40% of limits. The (1, 50%) rule passes it, but each of the two could compute the other's drawing. The (2, 85%) rule suppresses it.

R2. Absolute time only

Every period is a pair of explicit **local dates in the profile's time zone**: `from` inclusive and `until` exclusive. Periods sit on a fixed grid:

- **business days**, as defined by the calendar that applies;
- **calendar days**, for always-on channels such as card spend and digital transactions;
- **ISO weeks**, Monday 00:00 to the next Monday 00:00;
- **calendar months**;
- **quarters**, for context metrics only.

Never accept or return:

- relative windows such as "last 7 days", "1 hour ago" or "month to date as of now";
- a period that is still open.

A request whose dates are off the metric's grid is rejected with `off_grid` (§9, C04).

Working weeks other than Monday-Friday. The grid never depends on the working week:

- **Weeks are ISO weeks everywhere.** Every ISO week holds exactly one of each weekday. So where the working week is Sunday to Thursday (Saudi Arabia, Egypt, Bangladesh), each ISO week still holds the same five working days: Monday to Thursday, plus the Sunday that ends it.
- **Business days come from calendars.** Declare weekend days and holidays, including moving ones (Eid, Diwali, Lunar New Year, Easter, Poya days).
- **Weekend changes are rule changes.** If a weekend changes (the UAE moved to Saturday-Sunday on 1 January 2022), declare a `rule_change` break.

Calendars per region. One institution may need several calendars:

- India declares bank holidays per state.
- In Malaysia, Kedah, Kelantan and Terengganu work Sunday to Thursday while most states work Monday to Friday.

So the profile has a **primary calendar** plus one per region that differs. The rules:

- **Booking.** A record's value date that is not a business day **in its own region's calendar** moves to that calendar's next business day.
- **Multi-region totals.** Rows of a request that spans several calendars (a national total) are on the primary calendar's business days. A flow from a region whose business day is not one in the primary calendar moves to the primary calendar's next business day.

Seasons and salary cycles. Holiday flags align single days. Many behaviours run for weeks: Ramadan, Lunar New Year, the Diwali season, harvests, school-fee months. Salary cycles may follow a non-Gregorian month (Nepal's Bikram Sambat, Iran's Solar Hijri, Ethiopia's calendar). Calendars therefore carry standard flags, which the checks use for alignment (§6):

Flag	Meaning
`weekend`	a weekend day of this calendar
`public_holiday`	a holiday in this calendar (holidays[] names it)
`regional_holiday`	a holiday only in some regions; those regions' own calendars carry it as a public_holiday
`moving_holiday`	a holiday whose date moves year to year (lunar or lunisolar calendars, Easter)
`partial`	a business day with shortened hours
`after_holiday`	the first business day after one or more non-business days
`salary_day`	a day when the main payroll credits land (e.g. the 25th, the 27th, the last business day, or a local-calendar month start)
`pension_day`	a day when public pensions are credited
`month_end`	the last business day of the month
`quarter_end`	the last business day of the quarter
`season:<name>`	a day inside a multi-day season that changes behaviour: season:ramadan, season:lunar_new_year, season:diwali, season:harvest_<crop>, season:school_fees, season:pilgrimage
`campaign:<name>`	a day inside a recurring campaign (one-off campaigns are declared as breaks)
`dst_change`	a day of 23 or 25 hours (daylight-saving change)

Daylight saving. The time zone is an IANA name, so local dates follow daylight-saving changes. Days of 23 or 25 hours are flagged `dst_change`.

Which date a flow is booked on is part of each definition (R4). Nothing is excluded: holiday flows move to the next business day, and the checks compare aligned spans (same business days, same holiday and season make-up, same position in the month).

> **Example.** A German bank's daily `deposit_inflow` row `from: 2026-12-28, until: 2026-12-29` (a business day) includes credits valued on Saturday 26 December (a public holiday and a weekend day) and Sunday 27 December. No row exists for 25–27 December.

>

> **Counter-example.** An Indian bank uses only a national calendar. During Onam, Kerala branches are closed while the calendar says business day, and the state's deposit inflow seems to collapse for two days.

R3. Every value carries enough to be checked

Every row returned by `GET /series` carries:

Field	Meaning
`from`, `until`	the period, as local dates (R2)
`value`, and the series' `unit` and `currency`	the number, its unit, and its currency as an ISO 4217 code (null when the unit isn't money)
`numerator`, `denominator`	for ratios: both, from the same records as the value
`numerator`, `exposure`	for rates: the events and the units at risk
`volume`	the records behind the value. Each metric defines it once (accounts, loans, obligors, policies, transactions), and that definition never changes with the filter
`suppressed`, `suppression_reason`	R1
`published_at`	the **local date** this period's value was first produced (L3). `null` for back-filled rows
`backfilled`	true for periods produced at onboarding rather than when they closed. The checks treat them as published at their maximum lag; C12 ignores them
`data_as_of`, `vintage`, `revised`, `revision_held`	which version of the value this is (L4), and whether a newer revision is being held back by the revision guard (R1)

Vintages can be reconstructed. You don't need to have stored every past publication. For flows and counts, the value "as known through date D" is the sum of entries **posted** by D whose value date is in the period. For stocks and ratios, it comes from the end-of-day snapshots taken by D. State the first date with true or reconstructed vintages as `vintage_history_from`.

> **Example.** An Indian insurer's `claims_per_1000` for motor, week of 2026-11-16, region IN-MH: value 1.8399, numerator 2,113 claims, exposure 1,148,402 insured vehicles, volume 1,148,402, published 2026-11-30, vintage `same_age`.

>

> **Counter-example.** "Claims rose 12%". With no numerator, exposure or volume, nobody can tell whether 12% is 3 claims or 3,000.

R4. Definitions precise enough that two institutions compute the same number

Each metric in §5 lists what is **in** and what is **out**, its **booking date**, and its **volume**. The following rules hold for every metric unless its row says otherwise.

Topic	Rule
Reversals and corrections	Netted against the **original** transaction's booking date. They revise that period, and you serve the revision as a new vintage, subject to the revision guard (R1).
Internal and joint-account transfers	Transfers between accounts a customer holds alone **or jointly** at this institution are own-account transfers, and are out of customer flows. Transfers between **different customers** of this institution count as a debit for one and a credit for the other. Postings to the institution's own, internal, suspense and nostro accounts are always out.
Multi-currency accounts	Split by currency. Each foreign-currency part is treated as a foreign-currency product, and the base-currency part as a base-currency one.
Auto-renewals and rollovers	Never new business. A term deposit renewed automatically is not a placement; a gold loan renewed at maturity is not a new pledge; a renewed insurance policy is not a new policy.
Top-ups	Not new contracts. They are counted separately where they matter (`topups` in gold loans; the renewal top-up above the maturing amount in `td_placements`).
Staff	Products offered **only** to staff (staff loans, staff savings schemes) are out. Staff members' ordinary accounts are in, like any customer's.
Booking date	For flows: the **value date**, as a local date. Business-day metrics move non-business-day value dates to the region calendar's next business day. Calendar-day metrics keep the transaction's local date; for cards this is the **authorisation** date, not settlement. For stocks: the position at the end of the period's last business day. Each metric names its date (due date, issue date, reported date, trip end date…).
Collection rates	**Due-date cohorts.** Instalments and premiums due in the period count as collected if received **by the end of the 3rd business day after the due date**, in the record's calendar. Weekend and holiday due dates get the same time to clear as weekday ones. Each metric's lag includes these days.
Currency	A foreign-currency transaction is converted to the base currency **at its own transaction date's reference rate** (from the source declared for that use), never at the period-end rate. A metric **about** foreign currency has the currency rule `original` : served and judged in the currency the customer **paid or was paid in**, and totalled across currencies in the pivot currency at each transaction's own date. For remittances, that is the **sender's instructed currency** from the payment message. Only where a corridor's messages lack it is it the settlement currency, declared per corridor in the catalog.
Redenomination and high inflation	A redenominated base currency is restated over the whole history at the legal factor, and declared as a `currency_redenomination` break. Where `inflation_regime: high` , you still serve nominal amounts; the checks judge base-currency amounts in real terms using a CPI reference series (§6).
Region	Banks: the account's **home branch** (default) or the **customer's domicile** (declared once in the profile, required where there are no branches). Customer-level metrics (`digital_transactions` , `cash_withdrawals`) use the customer's region, not a device's or agent's location. Branch mergers are `classification_change` breaks. Insurers: the **risk location**, which is each insured location, the vehicle's registered or garaging address, or the insured person's address.
Insurance counts	Exposure and claims count **risks** (insured locations, vehicles, lives), not policies. A claim is **one per risk per loss event**: a hailstorm damaging 50 fleet vehicles is 50 claims, and a 40-site policy is 40 locations, each in its own region. Policy counts (`new_policies`) count policies, with the risks they cover as the `risks` extra. A group scheme, fleet or portfolio above 5% of exposure joining or leaving is a `large_scheme_change` break.
Frozen attributes: the cohort rule	Customer and account attributes (`segment` , `size_band` , `sector` , `sector_l2` , `employer_sector` , `age_band` , regions) are evaluated **as of `segment_as_of`** when a request gives one, which must be a Monday. Customers who **left before** that date keep the attribute of their **last day**. Customers who **joined after** it take their attribute at onboarding. Limits and other frozen account terms are held at their level on the **earlier of the period's start and the segment date**. So history before the segment date is the ordinary series, and the watch holds them fixed. Without `segment_as_of` , each period uses the attributes at its own start.
Unknown attribute	Records missing an attribute go to the value `unknown` , never dropped, so breakdowns add up to the total (C07).
Islamic measurement	Financing balances exclude **unearned (deferred) profit**. Instalments include profit, and ijara rentals count as instalments. Late-payment amounts given to charity are not collections. `offered_rate` is the **announced expected** profit rate, not the rate later distributed. Takaful contributions are **gross of the wakala fee**.

> **Example (currency).** A Kenyan bank's USD savings product receives USD 1,000 on 3 March and USD 1,000 on 28 March. With `currency_basis=original` , `deposit_inflow` for March is USD 2,000. With `currency_basis=base` , each credit is converted to KES at its own day's reference rate.

›

> **Counter-example.** A UK sender pays GBP 1,000 to a Pakistani bank through a money transfer operator that settles in USD. Serving `inward_remittances` in USD makes a GBP/USD move look like a change in remittances. Serve GBP, the sender's currency.

> **Example (cohort rule).** A Sri Lankan bank checks `installment_collection_rate` for `segment=remittance_linked` with `segment_as_of=2026-09-28` . A borrower whose remittances stopped in October stays in the segment. A borrower who repaid in full in March 2026 is counted with the segment they had on their last day, so year-ago spans aren't survivor-only.

›

> **Counter-example.** Applying today's segment to three years of history. Everyone who stopped receiving remittances drops out of the year-ago base, and a real fall disappears.

R5. Regions and sectors use standards

- **Regions.** `region_l1` is the first-level subdivision in ISO 3166-2 (LK-1, IN-MH, AE-DU, DE-BY, BR-SP, MX-CMX). `region_l2` is the second level where ISO 3166-2 has one (Sri Lanka's districts, e.g. LK-11). Otherwise it is institution-defined, mapped at onboarding to the national statistics office's area codes, with each value naming its parent. ISO code changes are `classification_change` breaks. Cross-border dimensions use ISO 3166-1 (`corridor`) or UN M49 sub-regions (`destination_region`).
- **Sectors.** Use ISIC Rev.4 **sections** (`sector` , A-U) and **divisions** (`sector_l2` , 01-99), so a shock to one industry can be separated. Garments (14) and food manufacturing (10) are both section C. NACE Rev.2 matches ISIC at these levels; NAICS and national lists are mapped through published concordances. Merchant category codes (ISO 18245) are mapped to ISIC sections through a table you publish with your catalog.

> **Example.** `sector=C, sector_l2=14` (wearing apparel) and `region_l1=SA-01` (Riyadh).

›

> **Counter-example.** `sector=Textiles & Garments` (a label from a local list) or `region=Western` . These are local labels another institution can't match.

R6. Neutral accounting and regulatory terms

The spec uses IFRS 9 and IFRS 17 concepts. Map your local equivalents once, in the profile's `accounting_framework` .

Spec term	Meaning	Local equivalents (examples)
days past due (dpd)	days since the oldest unpaid contractual instalment fell due, ignoring arrears below the declared materiality threshold (default none). **dpd keeps counting through a restructure** and resets only when the arrears are paid.	US GAAP / CECL delinquency days; India's SMA-0/1/2 buckets (1-30, 31-60, 61-90 days); local "arrears" buckets, mapped by their day bounds
more than 30 dpd (`_30` keys)	31 days or more: IFRS 9's rebuttable presumption ("more than 30 days past due") of a significant increase in credit risk (stage 2). Performing = 0-30 dpd.	30-plus-days-delinquent counted from day 31; India's SMA-1 and worse
write-off	the gross carrying amount derecognised because recovery is not reasonably expected	charge-off (US)
restructure	a modification because of the borrower's financial difficulty	EBA forbearance; US "modifications to borrowers experiencing financial difficulty"; rescheduling
moratorium / relief	a scheme-wide deferral of payments (regulatory or institution-wide)	payment holidays, COVID-19 deferrals, disaster relief schemes, farm-loan waivers
gross written premium	premiums written in the period. A non-IFRS 17 measure, still reported to supervisors in most markets. Book size uses the trailing 12-month total	GWP; takaful gross contributions
Islamic banking	profit for interest, financing for loan, the same dpd counts, receivables net of unearned profit (R4)	AAOIFI financial accounting standards; murabaha, ijara, musharakah, tawarruq, wadiah, mudarabah
Takaful	contribution for premium (gross of the wakala fee); certificate or participant for policy	family takaful (life), general takaful

The spec never names a regulator as a requirement. Where a local rule is stricter, or forces something the spec forbids (a dpd reset on restructure), declare it in the profile and as a `rule_change` break. The checks then know.

> **Example.** An Indian bank serves `roll_rate_to_30` from SMA-1 and worse (31+ days); a Gulf bank serves 31+ from its delinquency system. They agree.

›

> **Counter-example.** Serving `dpd_30_plus` as "stage 2 loans". Stage 2 also contains loans that are current but riskier, so the number means something else.

R7. Computable from systems institutions really run

Every metric comes from a system a bank or insurer already runs, without capturing new data. The table shows where.

Category	Source systems
Deposits, payments, remittances, FX	core banking (transactions with codes, value and posting dates, balances), channel logs, ATM and payment switch, remittance platform, treasury/FX dealing system
Lending, gold loans, vehicle finance, agricultural lending	loan or lease system (schedules, receipts, dpd snapshots), collections system, origination system, pawning system
Cards	card management system (statements, authorisations, settlements, fraud cases), acquiring switch
Trade finance	trade-finance system (LCs, collections), SWIFT / payment purpose codes
Investments, retirement, bancassurance	plan administration, fund distribution records, bancassurance sales records
Insurance	policy administration (inceptions, renewals, in-force risks), premium collection, claims system (notifications, loss events, payments), reinsurance system

> **Example.** `customer_closures` is closures with a customer-request reason code, per 1,000 open accounts. Both come straight from the account master.

›

> **Counter-example.** "Customer sentiment score from call notes". That needs new capture and judgement, and two institutions would never compute the same number.

R8. A starter set, then a small required set per category

Go live in two steps:

- **The starter set** (★ in §5), about a dozen metrics. Each is either already in supervisory or management reports, or one query over transaction or snapshot tables. Most institutions can serve it at L2 **in days**.
- **The required metrics** of each category you offer (1–4 per category; `insurer_company` has none). A universal bank offering every bank category has 34, and several need new aggregation (due-date collection rates, card statements, frozen limits). Expect **weeks**, not days.

Everything else is recommended or optional. Vintages (L4) and change concentration (L5) can come later.

Institution	Category	Metric	Why it's in the starter set
bank	`savings`	`deposit_inflow`	one query over transaction or snapshot tables
bank	`savings`	`withdrawals`	one query over transaction or snapshot tables
bank	`savings`	`balance`	already in supervisory or MIS reports
bank	`retail_loan`	`roll_rate_to_30`	one query over transaction or snapshot tables
bank	`retail_loan`	`outstanding`	already in supervisory or MIS reports
bank	`cards`	`card_spend`	already in supervisory or MIS reports
bank	`trade_finance`	`lc_openings`	already in supervisory or MIS reports
bank	`payments`	`digital_transactions`	already in supervisory or MIS reports
bank	`remittances`	`inward_remittances`	already in supervisory or MIS reports
insurer	`life`	`new_policies`	already in supervisory or MIS reports
insurer	`life`	`gwp`	already in supervisory or MIS reports
insurer	`health`	`claims_per_1000`	one query over transaction or snapshot tables
insurer	`motor`	`claims_per_1000`	one query over transaction or snapshot tables
insurer	`property`	`claims_per_1000`	one query over transaction or snapshot tables

3. Capability levels

Levels are cumulative. Each metric is served at some level. The profile states the lowest level across your required metrics, and a metric may declare its own.

Level	Name	You serve	It unlocks	Without it, the checks lose
L1	Values	One value per closed grid period, with unit and currency; suppression applied (R1); the profile declared (time zone, calendars, base currency, spec version).	Charts and levels shown as context next to an event brief.	Nothing can be shown from your data.
L2	Checkable values	L1, plus numerator and denominator for ratios, exposure for rates, and volume on every unsuppressed row; breakdowns as listed for the metric; segment_as_of honoured (R4 cohort rule).	Verdicts. Minimum-volume and small-denominator protections, rates that don't drift with book growth, filtered (segment, region) checks.	The checks can't tell whether a move rests on enough records, so they give no verdict on the metric. You get context only.
L3	Timed and deep	L2, plus published_at on every live row (back-filled rows say backfilled: true instead), the history the metric's test needs (history_months: 39 for seasonal, recent-vs-prior and trend tests, 27 for level tests), and breaks declared.	Seasonal tests with a full 24-month distribution; verdicts as soon as a period is published; honest handling of migrations and relief periods.	The checks assume each period is published only at its maximum lag, so verdicts arrive later. With short history, seasonal tests fall back to a weaker statistical test or give no verdict. Without breaks, a migration or a relief period can be read as customer behaviour.
L4	Vintages	L3, plus values as known through a date (known_through) and at a given age after the period ended (same_age_days); each row labels its vintage and whether it was revised. Past vintages may be reconstructed from posting timestamps (R3); the catalog states vintage_history_from.	Comparisons at the same age (young claims or late-posted repayments don't bias the verdict), final verdicts as soon as the watch is published, and revision checks that supersede a verdict when numbers change.	No revision checks. Verdicts stay provisional until the newest watch period has passed the metric's stable age, so a final answer can take 7 to 120 days longer.
L5	Change concentration	L4, plus GET /change-concentration: for two disjoint, equal-length windows, a band for the largest single contributor's share of the change, never its value or identity.	Dominance checks on the move itself: a verdict is never built on one obligor's drawdown or one merchant's collapse.	For metrics marked concentration_sensitive the checks give no verdict, because one customer could be driving the move; for others they proceed and note that dominance was not checked.

In plain words:

- **L1** lets the event brief show your numbers.
- **L2** is the first level at which a check can say yes or no.
- **L3** gives the tests their full history, and stops a system migration from being read as customer behaviour.
- **L4** gives faster final answers that stay right when numbers are revised.
- **L5** stops a single large customer from making a portfolio trend appear.

History each test needs. `seasonal_ratio`, `recent_vs_prior` and `trend` read about 39 months: 24 months of rolling spans, plus a year-ago span and a growth window, or the same windows two years back. `level_change` reads 27 months. Each metric's `history_months` follows its test.

Coverage of a category. Per category, the connector reports one of:

Status	Meaning
`none`	nothing is served
`partial`	some required metrics are missing, or fail an L1 or L2 conformance check
`required (level tests only)`	every required metric is served at L2+ and passes every L1 and L2 check, but history is below 39 months: `level_change` metrics give verdicts, seasonal and trend metrics don't yet
`required`	as above, with each metric's full `history_months` (or since the product's launch)
`recommended`	`required`, plus every recommended metric
`full`	everything, at L4 or above

4. Product taxonomy

Category	For	Product types
Deposits and accounts `savings`	bank	current account, savings account, term deposit, fc deposit
Investment and retirement products sold to customers `wealth`	bank	retirement plan, investment funds, structured products, securities sold
Gold-secured loans `gold_loan`	bank	gold loan
Retail lending `retail_loan`	bank	personal loan, housing loan, education loan, other secured consumer, personal overdraft
Vehicle finance `vehicle_finance`	bank	vehicle lease, auto loan
Cards `cards`	bank	credit card, charge card, debit card, prepaid card
Business lending `business_loan`	bank	working capital, term loan, program lending
Agricultural lending `agri_loan`	bank	crop loan, agri term loan, agri value chain
Trade finance `trade_finance`	bank	import lc, import collections, export finance
Payments and digital channels `payments`	bank	digital banking, self service, agent banking, domestic payments, merchant acquiring
Remittances `remittances`	bank	inward remittance, outward remittance
Foreign exchange for customers `fx`	bank	spot fx
Insurance distribution (bancassurance) `distribution`	bank	bancassurance
Life insurance and family takaful `life`	insurer	term life, savings life, unit linked, annuity, credit life, group life
Health and personal accident `health`	insurer	individual health, group health, personal accident
Motor `motor`	insurer	private motor, commercial motor, two three wheeler
Travel `travel`	insurer	single trip, annual multi trip, migrant worker, pilgrimage
Property `property`	insurer	home, commercial property, engineering
Marine `marine`	insurer	marine cargo, marine hull
Liability `liability`	insurer	general liability, professional liability, employers liability
Agriculture `agriculture`	insurer	crop indemnity, crop index, livestock
Micro insurance `micro_insurance`	insurer	micro life, micro health, micro property, mobile insurance
Insurer company level `insurer_company`	insurer	company

5. Metrics per category

Deposits and accounts bank · savings

Balances by product, currency and region are reported to supervisors almost everywhere (deposit returns, deposit-insurance returns); remittance inflows go to central banks for the balance of payments. Daily flows, segments, non-renewal and closures need new aggregation, but from transaction codes the core already holds.

Deposit inflow `deposit_inflow` REQUIRED STARTER

Is money coming into these accounts faster or slower than normal for this time of year?

Kind flow Unit currency Grain daily Currency product Published within 1 day History 39 months Adverse fall For current account, savings account, fc deposit

Breakdowns: segment, employer sector, age band, region l1, region l2, channel, currency

DEFINITION

In: cash deposits; incoming transfers from other institutions and from other customers of this institution; salary and pension credits; inward remittances credited to the account; cheques credited on clearing

Out: interest or profit credited; transfers between two accounts of the same customer at this institution; loan or financing disbursements; term-deposit maturities credited back; postings to the institution's own, internal, suspense and nostro accounts; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in); refunds of fees

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: accounts with at least one included credit in the period

Notes: Reversals and corrections are netted against the original transaction's booking date, so they revise that period (served as a new vintage). Joint accounts: transfers between accounts the same customer holds alone or jointly are own-account transfers. For a foreign-currency product the value is in its original currency; a multi-currency account is split by currency, each part treated as a foreign-currency product unless it is the base currency. segment=government carries the commodity channel for commodity-exporting economies.

HOW IT IS JUDGED

Method: `recent_vs_prior` · stable after 7 days · at least 30 volume

Thresholds: small robust z 3, pct change 15 · medium robust z 3, pct change 15 · large robust z 3, pct change 15

Withdrawals `withdrawals` REQUIRED STARTER

Are customers taking money out faster than normal?

Kind flow Unit currency Grain daily Currency product Published within 1 day History 39 months Adverse rise For current account, savings account, fc deposit

Breakdowns: segment, employer sector, age band, region l1, region l2, channel, currency

DEFINITION

In: cash withdrawals (branch, ATM, agent); outgoing transfers to other institutions or other customers; card purchases and cash advances debited to the account; cheques paid; standing orders and bill payments

Out: fees, charges and taxes debited by the institution; transfers between two accounts of the same customer at this institution (including repayments of the customer's own loans here); postings to the institution's own, internal, suspense and nostro accounts; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: accounts with at least one included debit in the period

Notes: Reversals and corrections are netted against the original transaction's booking date, so they revise that period (served as a new vintage). Joint accounts: transfers between accounts the same customer holds alone or jointly are own-account transfers.

HOW IT IS JUDGED

Method: `recent_vs_prior` · stable after 7 days · at least 30 volume

Thresholds: small robust z 3, pct change 15 · medium robust z 3, pct change 15 · large robust z 3, pct change 15

Deposit balance `balance` REQUIRED STARTER

How large is the book, and is a foreign-currency balance draining?

Kind stock Unit currency Grain daily Currency product Published within 1 day History 27 months Adverse fall For every product type

Breakdowns: segment, region l1, currency, tenor band

DEFINITION

In: customer balances in the product, including term deposits not yet matured

Out: accrued interest or profit not yet credited; postings to the institution's own, internal, suspense and nostro accounts; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: position at the end of the period's last business day

Volume: accounts with a non-zero balance at the period's end

Notes: Also the book size used to rank products. For a foreign-currency product it is in its original currency.

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 30 volume

Thresholds: small pct change 3 · medium pct change 3 · large pct change 3

Inward remittance credits `inward_remittance_credits` RECOMMENDED

Are remittances into these accounts falling, judged in the currency they were sent in?

Kind flow Unit currency Grain daily Currency original Published within 5 days History 39 months Adverse fall For current account, savings account, fc deposit

Breakdowns: corridor, segment, currency, region l1

DEFINITION

In: incoming cross-border personal transfers credited to accounts of the product, through correspondent banks, money transfer operators or remittance hubs

Out: payments with a trade, business or investment purpose code; returned or cancelled remittances (netted to the original date); postings to the institution's own, internal, suspense and nostro accounts

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: remittance credits (transactions)

Notes: Original currency = the currency the sender paid in (the instructed amount in the payment message), not the settlement currency; where the message lacks it, the settlement currency, declared in the catalog per corridor. Judged monthly. Related to the remittances category's inward_remittances, which covers every payout method; this one is scoped to one deposit product.

HOW IT IS JUDGED

Method: `seasonal_ratio`, judged monthly · stable after 7 days · at least 100 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 4 · medium percentile 5, pct change 4 · large percentile 5, pct change 4

Large-depositor net flow `large_depositor_net_flow` RECOMMENDED

Are the biggest depositors moving money out?

Kind flow Unit currency Grain daily Currency base Published within 1 day History 39 months Adverse fall For every product type

DEFINITION

In: the largest depositor customers who together hold 20% of total customer deposits, at least 30 customers, ranked on the first day of the month at or before the segment date; flows on all their deposit products, term deposits included

Out: transfers between two accounts of the same customer at this institution; postings to the institution's own, internal, suspense and nostro accounts; interest or profit credited

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: net = credits - debits, by the deposit_inflow and withdrawals rules across all deposit products; positive means a net inflow

Volume: customers in the group

Notes: Served under the category-level product group. Membership changes only monthly, so two segment dates in one month give the same group. Dominance is tested on each gross side (R1). Judged as a % of the group's baseline gross inflow.

HOW IT IS JUDGED

Method: `recent_vs_prior` · stable after 7 days · at least 30 volume · needs change concentration (L5)

Thresholds: small robust z 3, pct of gross inflow 10 · medium robust z 3, pct of gross inflow 10 · large robust z 3, pct of gross inflow 10

Term-deposit placements `td_placements` RECOMMENDED

Are customers placing more or less new money in term deposits (for example before a tax or rate change)?

Kind flow Unit currency Grain daily Currency product Published within 1 day History 39 months Adverse fall For term deposit

Breakdowns: tenor band, segment, region l1, currency

DEFINITION

In: new term deposits placed, whether funded from outside or from the customer's own current or savings account; on a renewal, only the amount above the maturing principal and interest

Out: automatic renewals and rollovers of maturing deposits; interest capitalised; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: deposits placed

Notes: Used with phases: anticipation (announcement to effective date) and effect.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 50

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Term-deposit non-renewal outflow `td_non_renewal_outflow` RECOMMENDED

Are maturing term deposits leaving instead of being renewed, or being broken early?

Kind flow Unit currency Grain weekly Currency product Published within 2 days History 39 months Adverse rise For term deposit

Breakdowns: tenor band, segment, outflow type, currency

DEFINITION

In: the part of each deposit maturing in the period that is not renewed; premature withdrawals (outflow_type=premature)

Out: automatic renewals; re-placement by the same customer into a term deposit within 7 calendar days of maturity, up to the matured amount (counts as renewal); products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: maturity date (or break date), local date; the 7-day re-placement rule revises a week for up to 7 days

Flow basis: gross; values are positive

Volume: deposits maturing or broken in the period

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 50

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

New accounts `new_accounts` RECOMMENDED

Are customers opening fewer accounts than normal for the season?

Kind count Unit count Grain weekly Currency none Published within 2 days History 39 months Adverse fall For every product type

Breakdowns: segment, channel, age band, region l1

DEFINITION

In: accounts opened by or for customers, any channel

Out: accounts opened for internal purposes; product switches of an existing account; sub-accounts created automatically; accounts opened and closed the same day

Booking date: opening date, local

Volume: accounts opened (the value itself)

Notes: Recurring campaigns (e.g. World Savings Day) are calendar flags; one-off campaigns are declared as episodes.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Customer-initiated closures `customer_closures` RECOMMENDED

Are customers closing accounts faster than normal?

Kind rate Unit per 1000 Grain weekly Currency none Published within 2 days History 39 months Adverse rise For current account, savings account, fc deposit

Breakdowns: segment, region l1

DEFINITION

Numerator: accounts closed at the customer's request in the period

Exposure: accounts open at the period's start

In: closures requested by the customer or their legal representative

Out: closures by the institution (dormancy, KYC, fraud, death); term-deposit maturities

Booking date: closure date, local

Volume: accounts open at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 1000 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 20 · medium percentile 5, pct change 20 · large percentile 5, pct change 20

Offered rate `offered_rate` RECOMMENDED

What rate are we offering, so the checks can compare it with rivals' public rates?

Kind level Unit percent pa Grain weekly Currency none Published within 2 days History 24 months For savings account, term deposit, fc deposit

Breakdowns: tenor band, currency

DEFINITION

In: the advertised standard rate (or the announced expected profit rate for profit-sharing accounts, not the rate later distributed) for the product's reference tenor, declared once in the catalog, at the period's end

Out: negotiated rates; averages of rates actually paid; special-scheme rates (e.g. senior-citizen schemes), unless the product is that scheme

Booking date: rate in force at the end of the period's last day

Volume: products priced (1 per product and tenor band)

Notes: Rivals' rates are public data: the checking system collects them as reference data and computes the gap itself.

HOW IT IS JUDGED

Method: `context`

Derived: net_deposits = deposit_inflow − withdrawals (judged as a % of the baseline's gross deposit_inflow, never as a % of itself; method recent_vs_prior or seasonal_ratio; adverse fall)

Investment and retirement products sold to customers bank · `wealth`

Fund values and contributions are in pension and securities regulators' returns. Subscriptions and redemptions are in distributors' sales records; early withdrawals and contribution rates need new aggregation.

Retirement contributions `contributions` REQUIRED

Are members paying in less than normal?

Kind flow Unit currency Grain monthly Currency base Published within 10 days History 39 months Adverse fall For retirement plan

Breakdowns: employer sector, region l1

DEFINITION

In: employer and member contributions; voluntary top-ups

Out: transfers in from other plans; investment income; contributions reversed (netted to the original date)

Booking date: value date of the contribution, local

Flow basis: gross; values are positive

Volume: members with at least one contribution in the month

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 200 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Contribution rate `contribution_rate` RECOMMENDED

Are fewer members contributing?

Kind ratio Unit percent Grain monthly Currency none Published within 10 days History 39 months Adverse fall For retirement plan

Breakdowns: employer sector

DEFINITION

Numerator: active members with at least one contribution in the month

Denominator: active members: members with at least one contribution in the 12 months before the month's start who are still in the plan

In:

Out: members who retired or left during the month

Booking date: value date of the contribution, local

Volume: active members (the denominator)

HOW IT IS JUDGED

Method: `trend` · stable after 30 days · at least 200 volume · denominator at least 100 · Wilson interval on counts

Thresholds: small forecast gap pp 1 · medium forecast gap pp 1 · large forecast gap pp 1

Early withdrawals `early_withdrawals` RECOMMENDED

Are members withdrawing savings before retirement, from hardship or emigration?

Kind rate Unit per 1000 Grain monthly Currency none Published within 10 days History 39 months Adverse rise For retirement plan

Breakdowns: withdrawal reason

DEFINITION

Numerator: early withdrawals paid (full or partial) before normal retirement age

Exposure: members at the period's start

In: hardship, emigration, housing, medical and education withdrawals

Out: payments at normal retirement age, death or disability; transfers to other plans

Booking date: payment date, local

Volume: members at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 500 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Investment subscriptions `investment_subscriptions` REQUIRED

Are customers buying fewer investment products?

Kind flow Unit currency Grain weekly Currency product Published within 2 days History 39 months Adverse fall

For investment funds, structured products, securities sold

Breakdowns: asset class, segment, channel

DEFINITION

In: purchases and subscriptions by customers, at trade date

Out: switches between funds of the same family (both legs); reinvested dividends; the institution's own treasury purchases; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: trade date, local

Flow basis: gross; values are positive

Volume: customers subscribing in the period

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Investment redemptions `investment_redemptions` REQUIRED

Are customers selling out of investment products early?

Kind flow Unit currency Grain weekly Currency product Published within 2 days History 39 months Adverse rise

For investment funds, structured products, securities sold

Breakdowns: asset class, segment, channel

DEFINITION

In: redemptions, early encashments and sales back to the institution

Out: scheduled maturities and coupon payments; switches within a fund family; products offered only to staff, such as staff loans and staff savings schemes (staff members' ordinary accounts stay in)

Booking date: trade date, local

Flow basis: gross; values are positive

Volume: customers redeeming in the period

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Fund value / customer holdings `fund_value` REQUIRED

How large is the book?

Kind stock Unit currency Grain daily Currency product Published within 1 day History 24 months For every product type

Breakdowns: asset class

DEFINITION

In: market value of members' plan balances, or of customer holdings of the product in the institution's records, at the latest published price

Out: the institution's own holdings

Booking date: position at the end of the period's last business day

Volume: customer holdings (members or holders) at the period's end

HOW IT IS JUDGED

Method: `book_size`

20-day fund return `fund_return_20d` OPTIONAL

Has the fund lost value in the last 20 business days to a date?

Kind level Unit percent Grain daily Currency none Published within 1 day History 27 months Adverse fall For retirement plan, investment funds

Breakdowns: asset class

DEFINITION

In: total return net of fees over the 20 business days ending on the row's date, from published prices

Out:

Booking date: the row's date; the 20-day window is fixed to that date, never to 'now'

Volume: funds (1 per fund)

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 1 volume

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

20-day return vs benchmark `fund_relative_return_20d` OPTIONAL

Is the fund doing worse than its benchmark?

Kind level Unit pp Grain daily Currency none Published within 1 day History 24 months For retirement plan, investment funds

Breakdowns: asset class

DEFINITION

In: fund_return_20d minus the declared benchmark's return over the same 20 business days

Out:

Booking date: the row's date

Volume: funds (1 per fund)

HOW IT IS JUDGED

Method: `context`

Gold-secured loans bank · `gold_loan`

Outstanding balances are reported to supervisors; most banks also report gold-loan LTV breaches internally. Pledge, redemption and auction counts come straight from the pawning system.

New pledges `new_pledges` REQUIRED

Are more households (or fewer) pledging gold for cash?

Kind count Unit count Grain daily Currency none Published within 1 day History 39 months Adverse rise, fall For every product type

Breakdowns: region l1, region l2

DEFINITION

In: new gold loans granted

Out: renewals at maturity; top-ups on existing tickets; transfers between branches

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Volume: loans granted (the value itself)

Notes: Rise = household stress; fall = lost on price (competitor). grams_fine is fine-gold grams pledged.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 30 volume · year-ago base at least 30

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Renewals `renewals` OPTIONAL

How many loans were rolled over at maturity?

Kind count Unit count Grain daily Currency none Published within 1 day History 24 months For every product type

Breakdowns: region l1

DEFINITION

In: tickets renewed or extended on the same collateral

Out: top-ups

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Volume: loans renewed

Notes: Context: follows last year's maturity cycle.

HOW IT IS JUDGED

Method: `context`

Top-ups `topups` OPTIONAL

How many borrowers drew more on existing pledges?

Kind count Unit count Grain daily Currency none Published within 1 day History 24 months For every product type

Breakdowns: region l1

DEFINITION

In: additional amounts lent on existing tickets

Out: renewals

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Volume: loans topped up

Notes: Context: rises when the gold price rises.

HOW IT IS JUDGED

Method: `context`

Redemptions `redemptions` REQUIRED

Are fewer borrowers redeeming their gold?

Kind count Unit count Grain daily Currency none Published within 1 day History 39 months Adverse fall For every product type

Breakdowns: region l1, region l2

DEFINITION

In: loans fully repaid and collateral returned

Out: renewals (old ticket closed into a new one); auctions

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Volume: loans redeemed (the value itself)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 30 volume · year-ago base at least 30

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Loans above the LTV limit `loans_above_ltv_limit` RECOMMENDED

How much of the book is now under-collateralised after a gold-price fall?

Kind ratio Unit percent Grain daily Currency base Published within 1 day History 27 months Adverse rise For every product type

Breakdowns: region l1

DEFINITION

Numerator: outstanding of loans whose loan-to-value is above the institution's policy limit

Denominator: outstanding of all gold loans

In: LTV = outstanding ÷ (fine grams × the declared reference gold price per gram on that day)

Out:

Booking date: position at the end of the period's last business day

Volume: loans outstanding (the denominator's loans)

Notes: The reference gold price and fineness basis (e.g. 22K in South Asia, 21K in the Gulf) are declared in the catalog.

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 200 volume

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

Overdue gold loans `overdue_pawns` RECOMMENDED

Are more loans past maturity without being renewed or redeemed?

Kind ratio Unit percent Grain weekly Currency base Published within 2 days History 27 months Adverse rise For every product type

Breakdowns: region l1

DEFINITION

Numerator: outstanding of loans past maturity, not renewed or redeemed

Denominator: outstanding of all gold loans

In:

Out:

Booking date: position at the end of the period's last business day

Volume: loans outstanding

HOW IT IS JUDGED

Method: `level_change` · stable after 14 days · at least 200 volume

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

Auctions `auctions` RECOMMENDED

Are more pledges going to auction?

Kind rate Unit per 1000 Grain weekly Currency none Published within 2 days History 39 months Adverse rise For every product type

Breakdowns: region l1

DEFINITION

Numerator: loans whose collateral was sold at auction in the period

Exposure: loans outstanding at the period's start

In:

Out: auctions cancelled before sale

Booking date: auction date, local

Volume: loans outstanding at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 200 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 20 · medium percentile 5, pct change 20 · large percentile 5, pct change 20

Outstanding `outstanding` REQUIRED

How large is the book?

Kind stock Unit currency Grain daily Currency base Published within 1 day History 24 months For every product type

Breakdowns: region l1

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: loans written off

Booking date: position at the end of the period's last business day

Volume: loans outstanding

HOW IT IS JUDGED

Method: `book_size`

Offered rate `offered_rate` RECOMMENDED

What rate are we offering, so the checks can compare it with rivals' public rates?

Kind level Unit percent pa Grain weekly Currency none Published within 2 days History 24 months For every product type

Breakdowns: tenor band

DEFINITION

In: the advertised standard rate for the product's declared reference tenor at the period's end

Out: negotiated rates; averages of rates actually charged

Booking date: rate in force at the end of the period's last day

Volume: products priced

HOW IT IS JUDGED

Method: `context`

Retail lending bank · `retail_loan`

Outstanding, dpd buckets, IFRS 9 stages, write-offs and restructures are reported to supervisors almost everywhere. Weekly collection rates, roll rates and request counts need new aggregation from the collections and loan systems.

Instalment collection rate `installment_collection_rate` REQUIRED

Are borrowers paying this period's instalments on time (the earliest sign of stress)?

Kind ratio Unit percent Grain weekly Currency base Published within 7 days History 27 months Adverse fall

For personal loan, housing loan, education loan, other secured consumer

Breakdowns: segment, employer sector, rate type, region l1, region l2

DEFINITION

Numerator: amounts received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period (partial payments count by amount; a payment is applied to the period's instalment before older arrears)

Denominator: scheduled instalments (principal plus interest or profit; ijara rentals) due in the period on loans not written off

In:

Out: payments of earlier arrears beyond what the instalment needs; prepayments of future instalments; instalments deferred by a moratorium (excluded from both sides); late-payment charges, including amounts paid to charity under Islamic late-payment undertakings

Booking date: instalment due date (a due-date cohort); payments by value date, local; foreign-currency instalments converted at the due date's reference rate

Volume: loans with an instalment due in the period

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 200 volume

Thresholds: small pp change 0.5 · medium pp change 0.5 · large pp change 0.5

Roll rate to 30+ dpd `roll_rate_to_30` REQUIRED STARTER

Is more of the performing book falling 30 days behind each month?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 39 months Adverse rise For every product type

Breakdowns: segment, employer sector, rate type, region l1, region l2

DEFINITION

Numerator: last month-end balance of those loans that are more than 30 dpd at this month's end

Denominator: balance at last month-end of loans then 0-30 dpd

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: loans written off or sold during the month (removed from both sides)

Booking date: month-end snapshots

Volume: loans in the denominator

HOW IT IS JUDGED

Method: `trend` · stable after 45 days · at least 50 volume

Thresholds: small forecast gap pp 0.15 · medium forecast gap pp 0.15 · large forecast gap pp 0.15

30+ days past due `dpd_30_plus` RECOMMENDED

What share of the book is 30 or more days past due?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 36 months For every product type

Breakdowns: segment, employer sector, rate type, region l1, region l2

DEFINITION

Numerator: balance more than 30 dpd at month end

Denominator: total outstanding balance at month end

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break; more than 30 dpd is IFRS 9's rebuttable presumption of a significant increase in credit risk (stage 2)

Out: loans written off

Booking date: month-end snapshot

Volume: loans outstanding

Notes: Context: book growth and write-offs move it.

HOW IT IS JUDGED

Method: `context` · stable after 45 days

Write-offs and restructures `writeoffs_and_restructures` OPTIONAL

How much was written off or restructured this month (explains dpd moves)?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: action, region l1

DEFINITION

In: balances written off (action=writeoff); balances modified because of the borrower's financial difficulty (action=restructure): IFRS 9 modifications, EBA forbearance, US 'modifications to borrowers experiencing financial difficulty'

Out: commercial renegotiations without financial difficulty; moratorium enrolments under a blanket scheme

Booking date: effective date of the write-off or modification

Flow basis: gross; values are positive

Volume: loans written off or restructured

HOW IT IS JUDGED

Method: `context`

Restructure requests `restructure_requests` RECOMMENDED

Are more borrowers asking to reschedule?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: restructure reason, region l1, region l2

DEFINITION

Numerator: requests from borrowers to reschedule, restructure or defer, by request date, granted or not

Exposure: loans outstanding at the period's start

In:

Out: institution-initiated restructures; automatic enrolment in a blanket moratorium (see moratorium_enrolled)

Booking date: request date, local

Volume: loans outstanding at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 200 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 30 · medium percentile 5, pct change 30 · large percentile 5, pct change 30

Moratorium enrolment `moratorium_enrolled` RECOMMENDED

How much of the book is under a payment moratorium or relief deferral?

Kind ratio Unit percent Grain weekly Currency base Published within 14 days History 24 months For every product type

Breakdowns: region l1, region l2

DEFINITION

Numerator: outstanding of loans under a moratorium or relief deferral at the period's end

Denominator: total outstanding at the period's end

In: regulatory and institution-wide relief schemes

Out: individual restructures

Booking date: position at the end of the period's last business day

Volume: loans outstanding

Notes: The mask metric: a rise of more than 2pp over the 4 periods before the anchor masks the credit-quality family.

HOW IT IS JUDGED

Method: `mask` · stable after 14 days · at least 200 volume

Loan applications `applications` RECOMMENDED

Is demand for credit rising or falling?

Kind count Unit count Grain weekly Currency none Published within 1 day History 39 months Adverse fall For every product type

Breakdowns: channel, employer sector, segment

DEFINITION

In: complete applications entered in the origination system

Out: duplicates for the same customer and product within 30 days; pre-approved offers not taken up

Booking date: application date, local

Volume: applications (the value itself)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Approval rate `approval_rate` OPTIONAL

Is the institution approving a smaller share of applications?

Kind ratio Unit percent Grain weekly Currency none Published within 1 day History 27 months Adverse fall For every product type

Breakdowns: channel

DEFINITION

Numerator: applications approved in the period

Denominator: applications approved or declined in the period (withdrawn excluded)

In:

Out: withdrawn applications

Booking date: decision date, local

Volume: applications decided (the denominator)

HOW IT IS JUDGED

Method: `level_change` · stable after 14 days · at least 50 volume · denominator at least 50 · Wilson interval on counts

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

Prepayments `prepayments` RECOMMENDED

Are borrowers paying off early, perhaps to refinance with a rival?

Kind flow Unit currency Grain weekly Currency base Published within 1 day History 39 months Adverse rise For every product type

Breakdowns: rate type

DEFINITION

In: full early settlements and partial prepayments of principal

Out: refinancing into another loan at this institution; scheduled instalments

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: loans prepaying in the period

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Outstanding `outstanding` REQUIRED STARTER

How large is the book?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: rate type, region l1

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: loans written off

Booking date: month-end snapshot

Volume: loans outstanding

HOW IT IS JUDGED

Method: `book_size`

Credit-line utilisation `facility_utilization` RECOMMENDED

Are households drawing more of their overdrafts and credit lines?

Kind ratio Unit percent Grain weekly Currency base Published within 2 days History 27 months Adverse rise For personal overdraft

Breakdowns: segment, employer sector, region l1

DEFINITION

Numerator: drawn balances at the period's end on the lines in the denominator

Denominator: approved limits of personal overdrafts and credit lines, held at their level on the earlier of the period's start and the segment date

In:

Out: credit cards (see cards); lines opened after the segment date (for periods after it)

Booking date: position at the end of the period's last business day

Volume: customers with lines in the denominator

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 200 volume

Thresholds: small pp change 0.6 · medium pp change 0.6 · large pp change 0.6

Vehicle finance bank · `vehicle_finance`

Outstanding and dpd are reported to supervisors; new contracts are in the leasing system. Collection rates need new aggregation.

Instalment collection rate `installment_collection_rate` REQUIRED

Are borrowers paying this period's instalments on time?

Kind ratio Unit percent Grain weekly Currency base Published within 7 days History 27 months Adverse fall For every product type

Breakdowns: vehicle type, new used, region l1, region l2

DEFINITION

Numerator: amounts received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period

Denominator: scheduled instalments (lease rentals) due in the period on contracts not written off

In:

Out: payments of earlier arrears; prepayments; deferred instalments; late-payment charges

Booking date: instalment due date (a due-date cohort); payments by value date

Volume: contracts with an instalment due in the period

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 200 volume

Thresholds: small pp change 0.5 · medium pp change 0.5 · large pp change 0.5

Roll rate to 30+ dpd `roll_rate_to_30` RECOMMENDED

Is more of the performing book falling 30 days behind?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 39 months Adverse rise For every product type

Breakdowns: vehicle type

DEFINITION

Numerator: last month-end balance of those contracts that are more than 30 dpd at this month's end

Denominator: balance at last month-end of contracts then 0-30 dpd

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: contracts written off or sold during the month

Booking date: month-end snapshots

Volume: contracts in the denominator

HOW IT IS JUDGED

Method: `trend` · stable after 45 days · at least 50 volume

Thresholds: small forecast gap pp 0.15 · medium forecast gap pp 0.15 · large forecast gap pp 0.15

Repossessions `repossessions` OPTIONAL

How many vehicles were repossessed (explains dpd)?

Kind rate Unit per 1000 Grain monthly Currency none Published within 15 days History 24 months For every product type

Breakdowns: vehicle type

DEFINITION

Numerator: vehicles repossessed in the month

Exposure: contracts outstanding at the month's start

In:

Out: voluntary returns at contract end

Booking date: repossession date

Volume: contracts outstanding at the period's start

HOW IT IS JUDGED

Method: `context`

New vehicle-finance contracts `new_leases` REQUIRED

Are fewer vehicles being financed?

Kind count Unit count Grain weekly Currency none Published within 1 day History 39 months Adverse fall For every product type

Breakdowns: vehicle type, new used, region l1

DEFINITION

In: new leases, hire-purchase contracts and vehicle loans activated (first disbursement or delivery)

Out: refinancing of existing contracts; contract transfers

Booking date: activation date, local

Volume: contracts activated (the value itself)

Notes: The key keeps the word 'leases' but covers vehicle loans and hire purchase too.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Moratorium enrolment `moratorium_enrolled` OPTIONAL

How much of the book is under a moratorium?

Kind ratio Unit percent Grain weekly Currency base Published within 14 days History 24 months For every product type

Breakdowns: region l1, region l2

DEFINITION

Numerator: outstanding under a moratorium or relief deferral

Denominator: total outstanding

In:

Out: individual restructures

Booking date: position at the end of the period's last business day

Volume: contracts outstanding

Notes: Optional; without it a declared relief episode masks the credit-quality family.

HOW IT IS JUDGED

Method: `mask` · stable after 14 days · at least 200 volume

Outstanding `outstanding` REQUIRED

How large is the book?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: vehicle type

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit (net investment in the lease for leases)

Out: contracts written off

Booking date: month-end snapshot

Volume: contracts outstanding

HOW IT IS JUDGED

Method: `book_size`

Cards bank · `cards`

Card counts, spend and receivables are reported to central banks' payment statistics in most countries. Payment and revolving rates need new aggregation from the card system's statement data.

Domestic card spend `card_spend` REQUIRED STARTER

Are cardholders spending less at home?

Kind flow Unit currency Grain daily Currency base Published within 2 days History 39 months Adverse fall For every product type

Breakdowns: merchant sector, region l1

DEFINITION

In: purchases at merchants in the profile's country (point of sale, contactless, domestic e-commerce, card-based QR) that settled

Out: purchases abroad or at foreign e-commerce merchants (see card_spend_cross_border); cash withdrawals and cash advances; refunds and chargebacks (purchases are gross); authorisations that never settled; fees, interest, balance transfers, quasi-cash (MCC 4829, 6050, 6051, 6540) and card-to-card transfers

Booking date: authorisation date, as a local date in the profile's time zone (not the settlement date); every calendar day is a period

Flow basis: gross purchases; values are positive

Volume: cards with at least one purchase in the period

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 500 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Cross-border card spend `card_spend_cross_border` RECOMMENDED

Are cardholders spending less abroad, judged in the currencies they spend in?

Kind flow Unit currency Grain daily Currency original Published within 2 days History 39 months Adverse fall For every product type

Breakdowns: merchant sector, currency, corridor

DEFINITION

In: purchases at merchants abroad and at foreign e-commerce merchants that settled, in the transaction currency

Out: the same exclusions as card_spend; dynamic-currency-conversion mark-ups

Booking date: authorisation date, local

Flow basis: gross purchases; values are positive

Volume: cards with at least one cross-border purchase in the period

Notes: Original currency, so a devaluation of the base currency doesn't raise it by arithmetic (the move would be pure arithmetic).

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 200 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Card payment rate `card_payment_rate` REQUIRED

Are cardholders paying less of their statements?

Kind ratio Unit percent Grain weekly Currency base Published within 4 days History 27 months Adverse fall For credit card, charge card

Breakdowns: segment

DEFINITION

Numerator: payments received from the statement date to the due date, or to the next business day when the due date is not a business day, capped at each statement's balance, for statements due in the period

Denominator: closing balances of statements whose due date falls in the period

In:

Out: instalment-plan balances not yet billed

Booking date: statement due date (a due-date cohort)

Volume: statements due in the period

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 200 volume

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

Revolving share `revolving_share` RECOMMENDED

Are more cardholders carrying balances past the due date?

Kind ratio Unit percent Grain monthly Currency base Published within 10 days History 39 months Adverse rise For credit card

Breakdowns: segment

DEFINITION

Numerator: statement balances minus payments received by the due date, for statements due in the month

Denominator: statement balances of statements due in the month

In:

Out: instalment-plan balances (0% or fixed-rate plans); balances in a promotional 0% period

Booking date: statement due date

Volume: statements due in the month

HOW IT IS JUDGED

Method: `trend` · stable after 30 days · at least 200 volume

Thresholds: small forecast gap pp 0.5 · medium forecast gap pp 0.5 · large forecast gap pp 0.5

Roll rate to 30+ dpd `roll_rate_to_30` RECOMMENDED

Is more of the performing card book falling 30 days behind?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 39 months Adverse rise For credit card, charge card

Breakdowns: segment

DEFINITION

Numerator: last month-end balance of those accounts that are more than 30 dpd at this month's end

Denominator: balance at last month-end of accounts then 0-30 dpd

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: accounts written off during the month

Booking date: month-end snapshots

Volume: accounts in the denominator

HOW IT IS JUDGED

Method: `trend` · stable after 45 days · at least 50 volume

Thresholds: small forecast gap pp 0.15 · medium forecast gap pp 0.15 · large forecast gap pp 0.15

Card fraud rate `card_fraud_rate` OPTIONAL

Is card fraud rising (a data breach at us, a rival or a merchant)?

Kind ratio Unit percent Grain weekly Currency base Published within 30 days History 27 months Adverse rise For every product type

Breakdowns: spend location

DEFINITION

Numerator: value of purchases made in the period that are later reported as fraudulent by the cardholder or detected by the institution

Denominator: value of all purchases made in the period (domestic and cross-border, in base currency)

In: fraud by transaction date, whenever reported

Out: chargebacks for merchant disputes that are not fraud

Booking date: transaction (authorisation) date; fraud reports revise the period

Volume: cards with spend in the period (the denominator's cards)

HOW IT IS JUDGED

Method: `level_change` · stable after 90 days · at least 500 volume

Thresholds: small pp change 0.02 · medium pp change 0.02 · large pp change 0.02

Write-offs and restructures `writeoffs_and_restructures` OPTIONAL

How much was written off or restructured (explains dpd)?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For credit card, charge card

Breakdowns: action

DEFINITION

In: balances written off (cards usually at 180 dpd); balances restructured because of financial difficulty

Out:

Booking date: effective date

Flow basis: gross; values are positive

Volume: accounts written off or restructured

HOW IT IS JUDGED

Method: `context`

Moratorium enrolment `moratorium_enrolled` OPTIONAL

How much of the card book is under a payment holiday?

Kind ratio Unit percent Grain weekly Currency base Published within 14 days History 24 months For credit card, charge card

Breakdowns: region l1

DEFINITION

Numerator: receivables under a payment holiday or relief deferral

Denominator: total receivables

In:

Out:

Booking date: position at the end of the period's last business day

Volume: accounts outstanding

Notes: Optional; without it a declared relief episode masks the credit-quality family.

HOW IT IS JUDGED

Method: `mask` · stable after 14 days · at least 200 volume

Card receivables `outstanding` REQUIRED

How large is the book?

Kind stock Unit currency Grain monthly Currency base Published within 10 days History 24 months For credit card, charge card

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: accounts written off

Booking date: month-end snapshot

Volume: accounts with a balance

HOW IT IS JUDGED

Method: `book_size`

Business lending bank · `business_loan`

Outstanding, exposures by sector and dpd/stages are in supervisory credit returns and large-exposure reports. Weekly utilisation, collection rates and the frozen-limit rule need new aggregation. Volume is obligors for every ratio.

Facility utilisation `facility_utilization` REQUIRED

Are businesses drawing more of their working-capital lines (cash-flow strain)?

Kind ratio Unit percent Grain weekly Currency base Published within 1 day History 27 months Adverse rise For working capital

Breakdowns: size band, sector, sector l2, segment, region l1

DEFINITION

Numerator: drawn balances at the period's end on the lines in the denominator

Denominator: approved limits of working-capital lines, held at their level on the earlier of the period's start and the segment date (so history before the segment date is the ordinary series and the watch holds limits fixed)

In: committed revolving lines, and overdrafts whether committed or not (where SME stress shows first); for murabaha working-capital programmes: the approved programme limit and the outstanding receivables net of unearned profit

Out: trade-finance lines (see trade_finance); lines opened after the segment date, for periods after it

Booking date: position at the end of the period's last business day

Volume: obligors with lines in the denominator

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 30 volume · needs change concentration (L5)

Thresholds: small pp change 0.6 · medium pp change 0.6 · large pp change 0.6

Instalment collection rate `installment_collection_rate` REQUIRED

Are businesses paying this period's instalments on time?

Kind ratio Unit percent Grain weekly Currency base Published within 7 days History 27 months Adverse fall For term loan, program lending

Breakdowns: size band, sector, sector l2, segment, region l1, region l2

DEFINITION

Numerator: amounts received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period

Denominator: scheduled instalments due in the period on loans not written off

In:

Out: payments of arrears; prepayments; deferred instalments; late-payment charges

Booking date: instalment due date (a due-date cohort); payments by value date

Volume: obligors with an instalment due

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 30 volume · needs change concentration (L5)

Thresholds: small pp change 0.5 · medium pp change 0.5 · large pp change 0.5

Roll rate to 30+ dpd `roll_rate_to_30` RECOMMENDED

Is more of the performing business book falling 30 days behind?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 39 months Adverse rise For every product type

Breakdowns: size band, sector, sector l2, segment

DEFINITION

Numerator: last month-end balance of those loans that are more than 30 dpd at this month's end

Denominator: balance at last month-end of loans then 0-30 dpd

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: loans written off or sold during the month

Booking date: month-end snapshots

Volume: obligors in the denominator

Notes: With few defaulters the numerator is often dominated, so the row is suppressed (numerator_dominance): honest for corporate books, where credit stress is checked through facility_utilization and installment_collection_rate.

HOW IT IS JUDGED

Method: `trend` · stable after 45 days · at least 50 volume · needs change concentration (L5)

Thresholds: small forecast gap pp 0.15 · medium forecast gap pp 0.15 · large forecast gap pp 0.15

30+ days past due `dpd_30_plus` RECOMMENDED

What share of the business book is 30+ days past due?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 36 months For every product type

Breakdowns: size band, sector, sector l2, segment

DEFINITION

Numerator: balance more than 30 dpd at month end

Denominator: total outstanding at month end

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: loans written off

Booking date: month-end snapshot

Volume: obligors

HOW IT IS JUDGED

Method: `context` · stable after 45 days

Returned cheque and direct-debit rate `returned_cheque_rate` OPTIONAL

Are more business payments bouncing for lack of funds?

Kind ratio Unit percent Grain weekly Currency none Published within 2 days History 27 months Adverse rise For every product type

Breakdowns: size band, sector, sector l2, instrument, region l1, region l2

DEFINITION

Numerator: cheques and direct debits drawn on business current accounts returned unpaid for insufficient funds

Denominator: cheques and direct debits drawn on those accounts presented for payment

In:

Out: returns for technical reasons (signature, date, stop payment, mandate errors)

Booking date: presentment date

Volume: obligors (business account holders) with items presented

HOW IT IS JUDGED

Method: `level_change` · stable after 14 days · at least 30 volume · denominator at least 50 · Wilson interval on counts

Thresholds: small pp change 1.5 · medium pp change 1.5 · large pp change 1.5

Restructure requests `restructure_requests` RECOMMENDED

Are more businesses asking to reschedule?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: size band, sector, sector l2, restructure reason, region l1, region l2

DEFINITION

Numerator: restructure, reschedule or deferral requests by request date

Exposure: obligors with loans outstanding at the period's start

In:

Out: institution-initiated restructures; automatic blanket-moratorium enrolment

Booking date: request date

Volume: obligors at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 200 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 30 · medium percentile 5, pct change 30 · large percentile 5, pct change 30

Moratorium enrolment `moratorium_enrolled` RECOMMENDED

How much of the business book is under a moratorium?

Kind ratio Unit percent Grain weekly Currency base Published within 14 days History 24 months For every product type

Breakdowns: size band, sector, region l1, region l2

DEFINITION

Numerator: outstanding under a moratorium or relief deferral

Denominator: total outstanding

In:

Out: individual restructures

Booking date: position at the end of the period's last business day

Volume: obligors

HOW IT IS JUDGED

Method: `mask` · stable after 14 days · at least 200 volume

Business credit applications `applications` OPTIONAL

Is business demand for credit changing?

Kind count Unit count Grain weekly Currency none Published within 1 day History 39 months Adverse fall For every product type

Breakdowns: size band, sector

DEFINITION

In: complete new-credit applications

Out: renewals and limit reviews of existing facilities; duplicates within 30 days

Booking date: application date

Volume: applications (the value itself)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 30 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Exposure `exposure` OPTIONAL

How concentrated is the book in a shocked sector?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: size band, sector

DEFINITION

In: outstanding plus undrawn committed limits

Out:

Booking date: month-end snapshot

Volume: obligors

Notes: Context: sector shares only.

HOW IT IS JUDGED

Method: `context`

Outstanding `outstanding` REQUIRED

How large is the book?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: size band

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: loans written off

Booking date: month-end snapshot

Volume: obligors

HOW IT IS JUDGED

Method: `book_size`

Agricultural lending bank · `agri_loan`

Agricultural lending is reported to supervisors in priority-sector or sectoral credit returns in most South Asian and African markets; disbursement and outstanding figures are cheap. Due-date collection rates need new aggregation.

Agricultural disbursements `disbursements` REQUIRED

Are farmers borrowing less for the season (prices, a drought, a policy change)?

Kind flow Unit currency Grain weekly Currency base Published within 2 days History 39 months Adverse fall For every product type

Breakdowns: crop group, size band, region l1, region l2

DEFINITION

In: new loans and drawdowns on seasonal limits paid out to farmers and agricultural businesses

Out: renewals of a limit without new funds; restructures and rollovers; interest capitalised

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: borrowers receiving a disbursement

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Instalment collection rate `installment_collection_rate` RECOMMENDED

Are farmers repaying what falls due after harvest?

Kind ratio Unit percent Grain monthly Currency base Published within 10 days History 27 months Adverse fall For every product type

Breakdowns: crop group, size band, region l1, region l2

DEFINITION

Numerator: amounts received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period

Denominator: scheduled instalments (including bullet repayments) due in the period on loans not written off

In:

Out: payments of earlier arrears; prepayments; deferred instalments

Booking date: instalment due date (a due-date cohort)

Volume: loans with an instalment due in the period

Notes: Monthly, because harvest-season due dates bunch; a loan-waiver announcement (regulation) typically stops repayments before it takes effect.

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 200 volume

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

Roll rate past 30 dpd `roll_rate_to_30` REQUIRED

Is more of the performing farm book falling more than 30 days behind?

Kind ratio Unit percent Grain monthly Currency base Published within 15 days History 39 months Adverse rise For every product type

Breakdowns: crop group, size band, region l1, region l2

DEFINITION

Numerator: last month-end balance of those loans that are more than 30 dpd at this month's end

Denominator: balance at last month-end of loans then 0-30 dpd

In: days past due: days since the oldest unpaid contractual instalment fell due, above the profile's declared materiality threshold (default none). 'Past 30 dpd' means more than 30 days (31+), matching IFRS 9's presumption and India's SMA-1 (31-60). dpd keeps counting through a restructure and resets only when the arrears are paid; a local rule that resets dpd on restructure is declared in the profile (dpd_reset_on_restructure) and as a rule_change break

Out: loans written off or sold during the month

Booking date: month-end snapshots

Volume: loans in the denominator

HOW IT IS JUDGED

Method: `trend` · stable after 45 days · at least 50 volume

Thresholds: small forecast gap pp 0.15 · medium forecast gap pp 0.15 · large forecast gap pp 0.15

Restructure requests `restructure_requests` RECOMMENDED

Are more farmers asking to reschedule after a bad season?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: restructure reason, crop group, region l1, region l2

DEFINITION

Numerator: requests to reschedule, restructure or defer, by request date

Exposure: loans outstanding at the period's start

In:

Out: institution-initiated restructures; blanket relief enrolment

Booking date: request date

Volume: loans outstanding at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 200 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 30 · medium percentile 5, pct change 30 · large percentile 5, pct change 30

Moratorium enrolment `moratorium_enrolled` RECOMMENDED

How much of the farm book is under relief?

Kind ratio Unit percent Grain weekly Currency base Published within 14 days History 24 months For every product type

Breakdowns: crop group, region l1, region l2

DEFINITION

Numerator: outstanding under a moratorium, relief deferral or loan-waiver scheme

Denominator: total outstanding

In:

Out: individual restructures

Booking date: position at the end of the period's last business day

Volume: loans outstanding

HOW IT IS JUDGED

Method: `mask` · stable after 14 days · at least 200 volume

Outstanding `outstanding` REQUIRED

How large is the book?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: crop group, region l1

DEFINITION

In: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: loans written off

Booking date: month-end snapshot

Volume: loans outstanding

HOW IT IS JUDGED

Method: `book_size`

Trade finance bank · `trade_finance`

LC openings, import payments and export receipts are reported in many central banks' foreign-exchange and trade returns. Guarantee claims are in large-exposure and contingent-liability reports.

Letters of credit opened `lc_openings` REQUIRED STARTER

Are importers opening fewer letters of credit?

Kind count Unit count Grain weekly Currency none Published within 1 day History 39 months Adverse fall For import lc

Breakdowns: size band, sector, sector l2, segment, lc type, currency

DEFINITION

In: import letters of credit issued in the period, including back-to-back LCs; one per underlying import contract, so tranches of one contract issued as separate LCs count once

Out: amendments, extensions and re-issues; standby LCs (guarantees)

Booking date: issue date in the trade-finance system (not the SWIFT send date), local

Volume: applicants (obligors) opening LCs

Notes: median_amount_pivot is served only under the median rule of R1 (at least 20 LCs, mean of the 4 central values, 2 significant figures).

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 10 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Import payments outside LCs `import_bills` REQUIRED

Are importers paying for fewer shipments on collection, open-account or advance terms?

Kind count Unit count Grain weekly Currency none Published within 1 day History 39 months Adverse fall For import collections

Breakdowns: size band, sector, sector l2, segment, terms, currency

DEFINITION

In: import payments under documentary collections, open account and advance payment, identified by purpose code or customs reference

Out: settlements under LCs; non-trade payments

Booking date: payment value date

Volume: importers (obligors) paying

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 10 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 4 · medium percentile 5, pct change 4 · large percentile 5, pct change 4

Export receipts `export_receipts` RECOMMENDED

Are exporters receiving less (or more) for their shipments, in the currency they invoice in?

Kind flow Unit currency Grain weekly Currency original Published within 1 day History 39 months Adverse fall For export finance

Breakdowns: size band, sector, sector l2, currency, corridor

DEFINITION

In: export proceeds received for business customers under LCs, collections and open account

Out: advance receipts for services; intra-group non-trade transfers

Booking date: value date

Flow basis: gross; values are positive

Volume: exporters receiving

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 10 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Trade-finance outstanding `outstanding` REQUIRED

How large is the funded trade book?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: size band

DEFINITION

In: import loans, trust receipts, bills discounted, pre- and post-shipment finance: gross carrying amount (principal plus accrued, unpaid interest or profit), before impairment allowances; for murabaha and other sale-based financing, the receivable net of unearned (deferred) profit

Out: contingent exposures (LCs, guarantees)

Booking date: month-end snapshot

Volume: obligors

HOW IT IS JUDGED

Method: `book_size`

Payments and digital channels bank · `payments`

Transaction counts and values by channel are reported to central banks' payment-system statistics in most countries; outage and failure reporting to supervisors is increasingly common. Active users and own-failure rates need new aggregation from channel logs.

Digital and self-service transactions `digital_transactions` REQUIRED STARTER

Are customers transacting less through digital channels (for example in a disaster area)?

Kind count Unit count Grain daily Currency none Published within 1 day History 39 months Adverse fall For every product type

Breakdowns: channel, region l1, region l2

DEFINITION

In: completed customer-initiated financial transactions on mobile, internet, ATM, agent and API channels: transfers, payments, bill payments, top-ups, cash withdrawals and deposits

Out: logins and enquiries; failed or reversed transactions; standing orders executed automatically

Booking date: transaction date (local date when the transaction completed) in the profile's time zone; every calendar day is a period

Volume: customers with at least one completed transaction

Notes: Each executed instruction counts once (a bulk file counts its payments). Region is the customer's region (R4), not the device's or agent's location.

HOW IT IS JUDGED

Method: `recent_vs_prior` · stable after 7 days · at least 500 volume

Thresholds: small robust z 3, pct change 10 · medium robust z 3, pct change 10 · large robust z 3, pct change 10

Own-system failure rate `failed_transactions_own` REQUIRED

Are our own systems failing more transactions (an outage or a trust problem)?

Kind ratio Unit percent Grain daily Currency none Published within 1 day History 27 months Adverse rise For every product type

Breakdowns: channel

DEFINITION

Numerator: attempts that failed because of the institution's own systems (technical declines, timeouts, internal errors)

Denominator: transactions attempted on digital and self-service channels

In:

Out: customer-caused failures (insufficient funds, wrong PIN, limits); failures in external networks, switches or other institutions (returned as the external_failures extra, context)

Booking date: transaction date (local date when the transaction completed) in the profile's time zone; every calendar day is a period

Volume: transactions attempted (the denominator)

HOW IT IS JUDGED

Method: `level_change` · stable after 7 days · at least 1000 volume · denominator at least 1000 · Wilson interval on counts

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

Active digital users `active_digital_users` RECOMMENDED

Are fewer customers using our app and internet banking (lost to a rival or after an incident)?

Kind count Unit count Grain monthly Currency none Published within 5 days History 39 months Adverse fall For every product type

Breakdowns: channel, segment, age band, region l1

DEFINITION

In: distinct customers with at least one completed financial transaction on mobile or internet banking in the month

Out: log-in-only users; test and staff accounts

Booking date: transaction dates, local

Volume: the value itself

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 1000 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 3 · medium percentile 5, pct change 3 · large percentile 5, pct change 3

Cash withdrawals `cash_withdrawals` RECOMMENDED

Are customers pulling cash (a trust scare, a disaster, a payment outage)?

Kind flow Unit currency Grain daily Currency base Published within 1 day History 39 months Adverse rise For every product type

Breakdowns: channel, region l1, region l2

DEFINITION

In: cash paid out to the institution's customers at its branches, ATMs and agents, and to them at other institutions' ATMs

Out: cash paid to other institutions' customers at its ATMs; cash advances on credit cards

Booking date: transaction date (local date when the transaction completed) in the profile's time zone; every calendar day is a period; region is the customer's region

Flow basis: gross; values are positive

Volume: customers withdrawing cash

HOW IT IS JUDGED

Method: `recent_vs_prior` · stable after 7 days · at least 500 volume

Thresholds: small robust z 3, pct change 10 · medium robust z 3, pct change 10 · large robust z 3, pct change 10

Merchant acquiring volume `merchant_acquiring_volume` RECOMMENDED

Are our merchants selling less (local spending, tourism)?

Kind flow Unit currency Grain daily Currency base Published within 2 days History 39 months Adverse fall For merchant acquiring

Breakdowns: merchant sector, card origin, region l1

DEFINITION

In: card and QR purchases acquired for the institution's merchants

Out: refunds and chargebacks; cash-back amounts

Booking date: transaction date (local date when the transaction completed) in the profile's time zone; every calendar day is a period

Flow basis: gross sales; values are positive

Volume: merchants with at least one acquired transaction

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 200 volume · year-ago base at least 100 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Remittances bank · `remittances`

Inward and outward remittances by corridor are reported to central banks for the balance of payments almost everywhere; cheap to expose.

Inward remittances `inward_remittances` REQUIRED STARTER

Is our remittance business receiving less from a corridor, in the currency sent?

Kind flow Unit currency Grain daily Currency original Published within 2 days History 39 months Adverse fall For inward remittance

Breakdowns: corridor, currency, payout method, region l1

DEFINITION

In: inward personal remittances paid out by any method, in the currency the sender paid in (the instructed amount in the payment message; settlement currency only where a corridor's messages lack it, declared in the catalog)

Out: trade, business and investment payments (by purpose code); transfers between institutions; cancelled or returned remittances (netted to the original date)

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day (payout date)

Flow basis: gross; values are positive

Volume: remittances paid (transactions)

Notes: Judged monthly. Covers non-account holders (cash pick-up); inward_remittance_credits in savings is the account-credit part for one deposit product.

HOW IT IS JUDGED

Method: `seasonal_ratio` , judged monthly · stable after 7 days · at least 100 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 4 · medium percentile 5, pct change 4 · large percentile 5, pct change 4

Outward remittances `outward_remittances` RECOMMENDED

Are customers sending less abroad (fees lost) or much more (capital flight)?

Kind flow Unit currency Grain daily Currency original Published within 2 days History 39 months Adverse fall, rise For outward remittance

Breakdowns: corridor, currency, channel

DEFINITION

In: outward personal remittances sent, in the currency sent

Out: trade and investment payments; cancelled transfers

Booking date: value date, as a local date in the profile's time zone; a value date on a non-business day is reported on the next business day

Flow basis: gross; values are positive

Volume: remittances sent (transactions)

HOW IT IS JUDGED

Method: `seasonal_ratio` , judged weekly · stable after 7 days · at least 100 volume · year-ago base at least 100

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Foreign exchange for customers bank · `fx`

Customer FX purchases and sales are reported to central banks in FX-position and FX-transaction returns in most markets with any FX management; forwards appear in derivatives reporting.

Customer FX purchases `customer_fx_purchases` REQUIRED

Are customers buying more foreign currency (pressure on our FX position) or less (lost business)?

Kind flow Unit currency Grain daily Currency original Published within 1 day History 39 months Adverse rise, fall For spot fx

Breakdowns: currency, segment, size band

DEFINITION

In: by transaction code: FX deal tickets with customers and account-to-account conversions where the customer buys foreign currency against the base currency, including outward FX payments debited to base-currency accounts

Out: anything settled through a card scheme or a remittance network, whatever the booking; interbank and own-account trading; cross-currency deals without a base-currency leg

Booking date: value date

Flow basis: gross; values are positive

Volume: customers buying

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Customer FX sales `customer_fx_sales` REQUIRED

Are customers converting more foreign currency into the base currency (e.g. under a conversion rule)?

Kind flow Unit currency Grain daily Currency original Published within 1 day History 39 months Adverse rise, fall For spot fx

Breakdowns: currency, segment, source

DEFINITION

In: by transaction code: FX deal tickets and account conversions where the customer sells foreign currency for the base currency, from foreign-currency deposits, export proceeds, remittances credited in foreign currency, and cash

Out: anything settled through a card scheme or a remittance network; interbank and own-account trading

Booking date: value date

Flow basis: gross; values are positive

Volume: customers selling

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 7 days · at least 50 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Insurance distribution (bancassurance) bank · `distribution`

Commission income is in financial reports and some conduct returns; policy-level sales data sits in the bank's distribution records or the partner insurer's reports.

Bancassurance new premium `bancassurance_new_premium` REQUIRED

Are we selling less insurance for our partners (after a partner switch, a rule change or a squeeze on households)?

Kind flow Unit currency Grain weekly Currency base Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: insurance line, channel, region l1

DEFINITION

In: annual premium equivalent: regular premiums annualised plus 10% of single premiums of policies issued through the bank's channels, by issue date

Out: renewals; policies cancelled in the free-look period (netted to the issue date)

Booking date: policy issue date

Flow basis: gross APE; values are positive

Volume: policies sold

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 37 days · at least 50 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Life insurance and family takaful insurer · `life`

GWP, new business and in-force counts are in supervisory returns; lapse and surrender rates appear in actuarial reports. Weekly collection rates and same-age death-claim counts need new aggregation from policy administration and claims systems.

Premium collection rate `premium_collection_rate` REQUIRED

Are policyholders paying fewer premiums when due (1-2 months before lapses show)?

Kind ratio Unit percent Grain weekly Currency base Published within 12 days History 27 months Adverse fall For every product type

Breakdowns: sales channel, collection method, region l1

DEFINITION

Numerator: premiums (contributions) received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period; payroll check-off receipts count when the employer's remittance arrives

Denominator: regular-premium instalments due in the period

In:

Out: single premiums; premiums waived under a waiver benefit; paid-up policies

Booking date: instalment due date (a due-date cohort); receipts by value date

Volume: policies with a premium due in the period

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 200 volume

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

New policies `new_policies` REQUIRED STARTER

Are we selling fewer new policies?

Kind count Unit count Grain weekly Currency none Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: sales channel, age band, region l1

DEFINITION

In: new policies issued (incepted), net of free-look cancellations netted to the issue date

Out: renewals of yearly-renewable group schemes; reinstatements; alterations and internal replacements

Booking date: issue date

Volume: policies issued (the value itself)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 37 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

New business premium `new_premium` RECOMMENDED

Is the value of new business falling?

Kind flow Unit currency Grain weekly Currency base Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: sales channel

DEFINITION

In: annual premium equivalent: regular premiums annualised plus 10% of single premiums of new policies, net of free-look cancellations

Out: renewal premiums

Booking date: issue date

Flow basis: gross APE; values are positive

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Lapse rate `lapse_rate` RECOMMENDED

Are more policies lapsing for non-payment?

Kind rate Unit per 1000 Grain monthly Currency none Published within 45 days History 39 months Adverse rise For every product type

Breakdowns: policy duration band, sales channel

DEFINITION

Numerator: policies whose lapse date (the end of grace) falls in the month and that were not reinstated within 90 days of it (or by data_as_of, if sooner)

Exposure: regular-premium policies in force at the month's start

In:

Out: surrenders; policies made paid-up; unit-linked discontinuances counted separately by local rule (map them to lapses)

Booking date: lapse date

Volume: policies in force at the period's start (the exposure)

Notes: Reinstatements after 90 days don't revise the month, so the value is final at the stable age whatever the local revival window.

HOW IT IS JUDGED

Method: `trend` · stable after 90 days · at least 1000 volume

Thresholds: small forecast gap pp 1 · medium forecast gap pp 1 · large forecast gap pp 1

Surrenders `surrenders` RECOMMENDED

Are policyholders cashing in savings policies (rates up elsewhere, or need for cash)?

Kind rate Unit per 1000 Grain weekly Currency none Published within 7 days History 39 months Adverse rise For savings life, unit linked, annuity

Breakdowns: sales channel

DEFINITION

Numerator: full surrenders effective in the period

Exposure: policies with a surrender value in force at the period's start

In:

Out: partial withdrawals; maturities

Booking date: surrender effective date

Volume: policies in force at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 1000 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 15 · medium percentile 5, pct change 15 · large percentile 5, pct change 15

Death claims `death_claims` RECOMMENDED

Are more death claims coming in (an epidemic, a disaster)?

Kind rate Unit per 1000 Grain weekly Currency none Published within 60 days History 39 months Adverse rise For every product type

Breakdowns: cause group, age band, region l1

DEFINITION

Numerator: death claims reported in the period

Exposure: lives insured at the period's start

In: claims by the date the claim was first notified to the insurer, in any form; compared at the same age (vintages) so late notifications don't bias recent periods

Out: duplicate notifications

Booking date: reported date

Volume: lives insured at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 5000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

New-money yield vs guarantee `new_money_yield_vs_guarantee` OPTIONAL

Is the yield on new investments falling below what in-force policies guarantee?

Kind level Unit pp Grain monthly Currency none Published within 15 days History 24 months For savings life, annuity

DEFINITION

In: average yield on fixed-income investments bought in the month minus the in-force-weighted guaranteed crediting rate

Out:

Booking date: month

Volume: portfolios (1)

HOW IT IS JUDGED

Method: `context`

Gross written premium `gwp` REQUIRED STARTER

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: sales channel

DEFINITION

In: first-year, single and renewal premiums written in the month; for takaful, gross contributions including the wakala fee

Out: reinsurance accepted

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: A non-IFRS 17 measure still reported to supervisors in most markets; IFRS 17 insurance revenue differs. Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Health and personal accident insurer · `health`

GWP, claims paid and claim counts are in supervisory statistical returns. Same-age frequency, renewal after grace and procedure cost indices need new aggregation.

Claims per 1,000 insured `claims_per_1000` REQUIRED STARTER

Are more claims coming in (an epidemic, a flood)?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: claim type, settlement mode, plan, region l1, region l2

DEFINITION

Numerator: claims reported in the period: one per insured life per episode of care (linked bills and pre-authorisations count once)

Exposure: insured persons (lives) at the period's start

In: cashless claims at the first pre-authorisation that becomes a claim; reimbursement claims at submission; the date the claim was first notified to the insurer, in any form; compared at the same age (vintages) so late notifications don't bias recent periods

Out: duplicate notifications; pre-authorisations never used

Booking date: reported date

Volume: insured persons at the period's start (the exposure)

Notes: Reimbursement claims can arrive up to about 45 days late; same-age vintages handle them.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Procedure cost index `procedure_cost_index` RECOMMENDED

Is the cost of common treatments and drugs rising?

Kind level Unit index Grain monthly Currency base Published within 15 days History 27 months Adverse rise For every product type

Breakdowns: claim type

DEFINITION

In: a fixed basket of the most frequent procedures and drugs (at least 20 items, at least 50% of base-year claims cost), priced from claims settled in the month; weights fixed for a year and chain-linked annually; base = 100

Out: items not settled in the month (carried at last price)

Booking date: settlement date

Volume: basket items priced

Notes: The basket is declared in the catalog; comparisons are within the institution over time.

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 20 volume

Thresholds: small pct change 3 · medium pct change 3 · large pct change 3

Median claim cost `median_claim_cost` RECOMMENDED

What does a typical claim cost now (context)?

Kind level Unit currency Grain monthly Currency base Published within 30 days History 24 months For every product type

Breakdowns: claim type, plan

DEFINITION

In: median of amounts paid on claims settled in the month; p75; settled_share = share of the month's reported claims already settled

Out: rejected claims

Booking date: settlement date

Volume: claims settled

HOW IT IS JUDGED

Method: `context`

Renewal rate `renewal_rate` RECOMMENDED

Are fewer policyholders renewing?

Kind ratio Unit percent Grain weekly Currency none Published within 37 days (renewal_grace_days + 7) History 27 months Adverse fall For every product type

Breakdowns: plan, sales channel

DEFINITION

Numerator: policies renewed by the end of the grace period

Denominator: policies whose renewal date falls in the period

In: measured after the profile's declared renewal grace period (default 30 days)

Out: policies the insurer declined to renew

Booking date: renewal date

Volume: policies due for renewal (the denominator)

Notes: max_lag_days = grace + 7; a longer declared grace lengthens it.

HOW IT IS JUDGED

Method: `level_change` · stable after 14 days · at least 200 volume

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

New policies `new_policies` REQUIRED

Are we selling fewer new policies?

Kind count Unit count Grain weekly Currency none Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: plan, sales channel, region l1

DEFINITION

In: new policies issued, net of free-look cancellations

Out: renewals; members added to existing group schemes

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 37 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: plan

DEFINITION

In: premiums (contributions) written in the month

Out: reinsurance accepted

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Motor insurer · `motor`

GWP, policy counts and claim counts are in supervisory returns and often in motor-pool or industry statistics. Parts cost indices and same-age frequency need new aggregation.

Claims per 1,000 vehicles `claims_per_1000` REQUIRED STARTER

Are more motor claims coming in (a flood, more traffic)?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: claim type, peril, vehicle type, cover, region l1, region l2

DEFINITION

Numerator: claims reported in the period: one per insured vehicle per loss event (a hailstorm damaging 50 fleet vehicles is 50 claims; one collision is one claim per insured vehicle involved)

Exposure: insured vehicles in force at the period's start (fleets count every vehicle)

In: claims by the date the claim was first notified to the insurer, in any form; compared at the same age (vintages) so late notifications don't bias recent periods; reported date is the first notice of loss to the insurer or its agent, not a broker's later batch; region is the vehicle's registered or garaging address

Out: duplicate notifications

Booking date: reported date

Volume: insured vehicles at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Parts cost index `parts_cost_index` RECOMMENDED

Are imported parts getting dearer?

Kind level Unit index Grain monthly Currency base Published within 15 days History 27 months Adverse rise For every product type

Breakdowns: vehicle type

DEFINITION

In: a fixed basket of common replacement parts per vehicle class, priced at settled invoices in the month; base = 100; weights fixed for a year

Out: labour

Booking date: settlement date

Volume: basket items priced

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 20 volume

Thresholds: small pct change 3 · medium pct change 3 · large pct change 3

Median claim cost `median_claim_cost` RECOMMENDED

What does a typical own-damage claim cost now (context)?

Kind level Unit currency Grain monthly Currency base Published within 30 days History 24 months For every product type

Breakdowns: vehicle type

DEFINITION

In: own-damage claims settled in the month

Out: total losses; rejected claims

Booking date: settlement date

Volume: claims settled

HOW IT IS JUDGED

Method: `context`

New policies `new_policies` REQUIRED

Are we insuring fewer new vehicles (import rules, prices)?

Kind count Unit count Grain weekly Currency none Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: vehicle type, cover, new used, sales channel

DEFINITION

In: policies issued for vehicles not insured with the insurer in the previous 30 days

Out: renewals; mid-term changes

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Renewal rate `renewal_rate` RECOMMENDED

Are fewer vehicle owners renewing with us?

Kind ratio Unit percent Grain weekly Currency none Published within 37 days (renewal_grace_days + 7) History 27 months Adverse fall For every product type

Breakdowns: vehicle type, cover

DEFINITION

Numerator: policies renewed by the end of the grace period

Denominator: policies whose renewal date falls in the period

In: measured after the profile's declared renewal grace period (default 30 days)

Out: policies the insurer declined to renew; vehicles sold or scrapped (where recorded)

Booking date: renewal date

Volume: policies due for renewal

HOW IT IS JUDGED

Method: `level_change` · stable after 14 days · at least 200 volume

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: cover

DEFINITION

In: premiums written in the month

Out: reinsurance accepted

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Travel insurer · `travel`

GWP and policy counts are in supervisory returns; claims by trip end date and destination need new aggregation.

New policies `new_policies` REQUIRED

Are fewer people buying travel cover (a weaker currency, trouble at a destination)?

Kind count Unit count Grain weekly Currency none Published within 2 days History 39 months Adverse fall For every product type

Breakdowns: traveller type, destination region, sales channel

DEFINITION

In: policies issued (sold)

Out: policies cancelled before departure (netted to the issue date)

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Claims per 1,000 trips `claims_per_1000` RECOMMENDED

Are more travellers claiming after trouble abroad?

Kind rate Unit per 1000 Grain monthly Currency none Published within 45 days History 39 months Adverse rise For every product type

Breakdowns: destination region, claim type

DEFINITION

Numerator: claims reported on policies whose trip ended in the period

Exposure: policies whose trip ended in the period

In:

Out: duplicate notifications

Booking date: trip end date (claims are filed after the trip)

Volume: policies whose trip ended in the period (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Median claim cost (original currency) `median_claim_cost` RECOMMENDED

What does a typical claim abroad cost, in the currency it is paid in (context)?

Kind level Unit currency Grain monthly Currency original Published within 45 days History 24 months For every product type

Breakdowns: claim type, currency

DEFINITION

In: median paid amount of claims settled in the month, in the claim currency (pivot currency when unfiltered)

Out: rejected claims

Booking date: settlement date

Volume: claims settled

Notes: A weaker base currency raises the base-currency cost by arithmetic only; that is why the rule is original.

HOW IT IS JUDGED

Method: `context`

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: traveller type

DEFINITION

In: premiums written in the month

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Property insurer · `property`

GWP, sums insured and catastrophe accumulations by area are reported to supervisors and reinsurers; same-age claim frequency needs new aggregation.

Claims per 1,000 insured locations `claims_per_1000` REQUIRED STARTER

Did a disaster drive up claims where we insure?

Kind rate Unit per 1000 Grain weekly Currency none Published within 14 days History 39 months Adverse rise For every product type

Breakdowns: peril, region l1, region l2

DEFINITION

Numerator: claims reported in the period: one per insured location per loss event

Exposure: insured locations in force at the period's start (a multi-site policy counts each site, in its own region)

In: claims by the date the claim was first notified to the insurer, in any form; compared at the same age (vintages) so late notifications don't bias recent periods; region is the insured location (which is also the loss location)

Out: duplicate notifications

Booking date: reported date

Volume: insured locations at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Median claim cost `median_claim_cost` RECOMMENDED

What does a typical claim cost (context for rebuild costs)?

Kind level Unit currency Grain monthly Currency base Published within 30 days History 24 months For every product type

Breakdowns: peril

DEFINITION

In: claims settled in the month

Out: rejected claims

Booking date: settlement date

Volume: claims settled

HOW IT IS JUDGED

Method: `context`

Sum insured `sum_insured` RECOMMENDED

How much do we insure in the affected area?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: region l1, region l2

DEFINITION

In: sums insured of policies in force at month end, split by insured location

Out: reinsurance recoveries

Booking date: month-end snapshot

Volume: policies in force

HOW IT IS JUDGED

Method: `context`

New policies `new_policies` OPTIONAL

Are we writing fewer new property policies?

Kind count Unit count Grain weekly Currency none Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: sales channel, region l1

DEFINITION

In: new policies issued

Out: renewals

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 14 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: region l1

DEFINITION

In: premiums written in the month

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Marine insurer · `marine`

GWP is reported; declarations under open covers are in the underwriting system. Shipment counts need new aggregation.

Insured shipments `insured_shipments` REQUIRED

Are our cargo clients shipping less (tariffs, a weaker currency, a port closure)?

Kind count Unit count Grain monthly Currency none Published within 30 days History 39 months Adverse fall For marine cargo

Breakdowns: trade direction, commodity group, corridor

DEFINITION

In: shipments insured: single-voyage policies and declarations under open covers

Out: cancelled declarations

Booking date: sailing or dispatch date

Volume: insured clients declaring

Notes: Declarations under open covers often arrive a month late; vintages and stable age 60 handle them.

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 60 days · at least 20 volume · year-ago base at least 20 · needs change concentration (L5)

Thresholds: small percentile 5, pct change 8 · medium percentile 5, pct change 8 · large percentile 5, pct change 8

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

DEFINITION

In: premiums written in the month, including declaration premiums

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Liability insurer · `liability`

GWP and policy counts are reported; claims are long-tailed and reported by underwriting year in actuarial returns.

New policies `new_policies` REQUIRED

Are businesses buying less liability cover?

Kind count Unit count Grain monthly Currency none Published within 15 days History 39 months Adverse fall For every product type

Breakdowns: liability line, sector, sales channel

DEFINITION

In: new policies issued

Out: renewals

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Renewal rate `renewal_rate` RECOMMENDED

Are fewer clients renewing?

Kind ratio Unit percent Grain monthly Currency none Published within 45 days (renewal_grace_days + 15) History 27 months Adverse fall For every product type

Breakdowns: liability line, sector

DEFINITION

Numerator: policies renewed by the end of the grace period

Denominator: policies whose renewal date falls in the month

In: measured after the profile's declared renewal grace period (default 30 days)

Out: policies the insurer declined to renew

Booking date: renewal date

Volume: policies due for renewal

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 100 volume

Thresholds: small pp change 2 · medium pp change 2 · large pp change 2

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: liability line

DEFINITION

In: premiums written in the month

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Agriculture insurer · `agriculture`

Public schemes report enrolments, sums insured and claims to the scheme administrator and supervisor; cheap to expose where a scheme exists.

New policies (enrolments) `new_policies` REQUIRED

Are fewer farmers insuring this season?

Kind count Unit count Grain monthly Currency none Published within 15 days History 39 months Adverse fall For every product type

Breakdowns: crop group, scheme, region l1, region l2

DEFINITION

In: policies or scheme enrolments incepted in the month

Out: cancelled enrolments (netted to inception)

Booking date: inception date

Volume: policies (farmer enrolments)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 30 days · at least 50 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 10 · medium percentile 5, pct change 10 · large percentile 5, pct change 10

Sum insured `sum_insured` REQUIRED

How much crop and livestock value do we cover where a disaster hit?

Kind stock Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: crop group, region l1, region l2

DEFINITION

In: sums insured of policies in force at month end

Out:

Booking date: month-end snapshot

Volume: policies in force

HOW IT IS JUDGED

Method: `context`

Claims per 1,000 policies `claims_per_1000` RECOMMENDED

Did drought, flood or pests trigger more claims or index payouts?

Kind rate Unit per 1000 Grain monthly Currency none Published within 30 days History 39 months Adverse rise For every product type

Breakdowns: peril, crop group, region l1, region l2

DEFINITION

Numerator: claims reported, or index payouts triggered (at the trigger date)

Exposure: policies in force at the month's start

In:

Out: duplicate notifications

Booking date: reported or trigger date

Volume: policies in force at the period's start (the exposure)

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

Breakdowns: scheme

DEFINITION

In: premiums written in the month, including the subsidised part

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Micro insurance insurer · `micro_insurance`

Micro-insurance returns are required where a local micro-insurance rule exists; otherwise the products appear inside life or general returns. Collection rates by method need new aggregation.

New policies `new_policies` REQUIRED

Are fewer low-income households taking cover?

Kind count Unit count Grain weekly Currency none Published within 7 days History 39 months Adverse fall For every product type

Breakdowns: sales channel, region l1

DEFINITION

In: policies issued that meet the local micro-insurance definition, or the declared sum-insured ceiling where none exists

Out: renewals

Booking date: issue date

Volume: policies issued

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 37 days · at least 20 volume · year-ago base at least 20

Thresholds: small percentile 5, pct change 5 · medium percentile 5, pct change 5 · large percentile 5, pct change 5

Premium collection rate `premium_collection_rate` REQUIRED

Are households missing small premium payments (an early stress signal)?

Kind ratio Unit percent Grain weekly Currency base Published within 12 days History 27 months Adverse fall For every product type

Breakdowns: collection method, region l1

DEFINITION

Numerator: premiums received by the end of the 3rd business day after each instalment's due date (in the record's own calendar), so weekend and holiday due dates get the same time to clear as weekday ones, against instalments due in the period

Denominator: regular-premium instalments due in the period

In: airtime and wallet deductions that succeeded

Out: single premiums

Booking date: instalment due date (a due-date cohort)

Volume: policies with a premium due

HOW IT IS JUDGED

Method: `level_change` · stable after 30 days · at least 200 volume

Thresholds: small pp change 1 · medium pp change 1 · large pp change 1

Lapse rate `lapse_rate` RECOMMENDED

Are more micro policies lapsing?

Kind rate Unit per 1000 Grain monthly Currency none Published within 45 days History 39 months Adverse rise For every product type

Breakdowns: collection method

DEFINITION

Numerator: policies whose lapse date falls in the month and that were not reinstated within 90 days of it (or by data_as_of, if sooner)

Exposure: regular-premium policies in force at the month's start

In:

Out:

Booking date: lapse date

Volume: policies in force at the period's start

HOW IT IS JUDGED

Method: `trend` · stable after 90 days · at least 1000 volume

Thresholds: small forecast gap pp 1 · medium forecast gap pp 1 · large forecast gap pp 1

Claims per 1,000 insured `claims_per_1000` RECOMMENDED

Are more claims coming in (an epidemic, a disaster)?

Kind rate Unit per 1000 Grain monthly Currency none Published within 30 days History 39 months Adverse rise For every product type

Breakdowns: region l1

DEFINITION

Numerator: claims reported in the month

Exposure: insured persons (or policies) at the month's start

In:

Out: duplicate notifications

Booking date: reported date

Volume: insured persons or policies at the period's start

HOW IT IS JUDGED

Method: `seasonal_ratio` · stable after 90 days · at least 1000 volume · year-ago base at least 10

Thresholds: small percentile 5, pct change 25 · medium percentile 5, pct change 25 · large percentile 5, pct change 25

Gross written premium `gwp` REQUIRED

How large is the book?

Kind flow Unit currency Grain monthly Currency base Published within 15 days History 24 months For every product type

DEFINITION

In: premiums written in the month

Out:

Booking date: written date

Flow basis: gross; values are positive

Volume: policies with premium written

Notes: Book size in the catalog is the trailing 12-month total, not one month.

HOW IT IS JUDGED

Method: `book_size`

Insurer company level insurer · `insurer_company`

Published solvency figures and reinsurance costs are in public disclosures and financial statements.

Solvency ratio (published) `solvency_ratio` OPTIONAL

Where does published capital stand (context for investment shocks)?

Kind ratio Unit percent Grain quarterly Currency base Published within 45 days History 24 months For every product type

DEFINITION

Numerator: eligible own funds or available capital

Denominator: required capital under the local regime

In: the latest publicly disclosed figure only (e.g. a Solvency II SCR ratio, a risk-based capital ratio)

Out: unpublished regulatory figures

Booking date: disclosure reference date

Volume: entities (1)

HOW IT IS JUDGED

Method: `context`

Reinsurance cost `reinsurance_cost` OPTIONAL

How much do we pay for reinsurance, in the currencies it is priced in?

Kind flow Unit currency Grain quarterly Currency original Published within 45 days History 24 months For every product type

Breakdowns: currency

DEFINITION

In: reinsurance premiums ceded in the quarter

Out: commissions received

Booking date: written date

Flow basis: gross; values are positive

Volume: treaties and facultative placements

HOW IT IS JUDGED

Method: `context`

6. Validation parameters

These parameters are **owned by the checking system**, not served by institutions. They are versioned as `validation_params_version` 1.0.0. They appear here so an institution can see how its numbers will be judged.

Field	Meaning
`method`	default test: `recent_vs_prior` (days timing), `seasonal_ratio` (weeks and months timing, flows and counts), `level_change` (ratios and levels at the same position in the month or cycle), `trend` (monthly ratios that drift). `context`, `book_size` and `mask` metrics are never tested.
`judge_grain`	when a daily metric is judged on a coarser grain (remittances are judged monthly)
`stable_age_days`	days after a period's last day when its value stops being revised. Without vintages, no final verdict is given before it. With vintages, a final verdict is re-checked at this age. For new policies it is the free-look period + 7.
`min_volume`	the smallest volume a verdict is built on (below it, no verdict)
`min_denominator`	the smallest denominator a ratio is judged on, in its own units
`min_base`	the smallest year-ago count a seasonal ratio may divide by (below it, no verdict)
`counts`	numerator and denominator are counts, so the change must also pass a 95% Wilson interval
`mask_family`, `masked_by`	Credit-quality metrics are masked when any trigger metric served for the product rises beyond its limit over the 4 periods before the anchor: `moratorium_enrolled` by more than 2pp, or `restructure_requests` by more than 3 per 1,000. Where none is served, a declared relief episode masks them. Premium-collection and lapse metrics are masked by a declared premium-relief episode.
`adverse_allowed`	the adverse directions a task may name
`concentration_sensitive`	without L5 (change concentration), the checks give no verdict on this metric, because one customer could be driving the move
`thresholds`	a threshold set per expected size (`small`, `medium`, `large`), magnitudes signed by the task's direction. Tasks name it as `<metric>.<size>`. **One value for every size** until placebo runs on the institution's own history support splitting them.

Rules the checks apply to every metric:

Rule	What the checks do
Season coverage	A baseline span whose share of days under any `season:<name>` flag differs from the watch's by more than 20 points is dropped. Example: a March with 30 Ramadan days vs one with 19.
Real terms	Where `inflation_regime: high`, base-currency amounts are deflated by the CPI reference series before any test. Ratios, counts and original-currency amounts are not.
Exposure shift	A rate whose exposure changes by more than 10% between the anchor's period and any watch period, without a declared `large_scheme_change` break, gives no verdict. With the break declared, spans before it are dropped.
Change concentration	The `top_share_band` from L5 counts as dominated when its lower bound is at or above the task's dominance limit (default 0.5).
Back-filled rows	Treated as published at the metric's maximum lag; they never block a final verdict.
Held revisions	A row with `revision_held: true` is final only once the period passes its stable age.

All values are starting points. The checking system recalibrates them with placebo runs on each institution's own history before any alert reaches a banker or underwriter.

Category	Key	Method	Stable age (d)	Min volume	Min denominator	Min base	Mask	Thresholds (small = medium = large)
`savings`	`deposit_inflow`	recent_vs_prior	7	30	—	—	—	robust_z 3, pct_change 15

7. Standard dimensions

Dimension	Values	About it
`region_l1` frozen at the segment date	ISO 3166-2 first-level subdivision codes of the profile's country, plus unknown	First-level region (state, province, emirate, region). Banks: the account's home branch, or the customer's domicile if the profile declares `region_basis: customer_domicile` (required for institutions without branches). Customer-level metrics such as digital_transactions use the customer's region on the same basis. Insurers: the risk location (each insured location, the vehicle's registered address, the insured person's address). Each value names the business calendar that applies to it. Examples: LK-1, IN-MH, AE-DU, SA-01, DE-BY, BR-SP, MX-CMX. Source: ISO 3166-2
`region_l2` frozen at the segment date	ISO 3166-2 second-level codes where the standard has them (e.g. LK-11), otherwise institution_defined and mapped at onboarding to the national statistics office's code, plus unknown	Second-level region (district, county, department, municipality). Every value names its region_l1 parent. Same basis as region_l1. Source: ISO 3166-2, or the national statistics office's area codes
`corridor`	ISO 3166-1 alpha-2 codes, plus unknown	The other country in a cross-border flow: the sending country for inward remittances, the receiving country for outward ones, the foreign origin or destination for trade and cargo. Taken from the payment or shipment record, not the customer. Source: ISO 3166-1
`destination_region`	UN M49 sub-region codes (e.g. 145 Western Asia, 035 South-eastern Asia, 154 Northern Europe), plus unknown	Where a trip goes (travel insurance). The first destination outside the home country named on the policy. Source: UN M49 standard country or area codes
`currency`	ISO 4217 alphabetic codes, plus unknown	The original currency of the transaction, account or contract. Source: ISO 4217
`segment` frozen at the segment date	remittance_linked, pensioner, student, salaried, other_individual, importer, exporter, domestic_business, government, non_bank_financial, unknown	One value per customer, the first rule that applies, in this order. Individuals: remittance_linked (≥1 inward personal remittance credited to any of the customer's accounts in the 6 months before the segment date); pensioner (≥1 pension credit in the 3 months before); student (holds a student product at the segment date; a declared occupation alone doesn't count); salaried (a salary credit, by payroll code or employer bulk credit, in at least 2 of the 3 months before); other_individual. Organisations: government (central and local government, public agencies and state-owned enterprises, by customer type); non_bank_financial (insurers, funds, brokers, finance companies); then businesses by trade payments in the 12 months before: importer (import payments > export receipts), exporter (export receipts ≥ import payments > 0, or receipts only), domestic_business (neither). Joint accounts take the primary holder's segment. Source: this spec; computed from the institution's own transactions and customer type
`age_band` frozen at the segment date	under_18, 18_24, 25_34, 35_49, 50_64, 65_plus, unknown	Age of the individual customer (the primary holder) at the segment date. Source: this spec
`size_band` frozen at the segment date	startup, micro, sme, corporate, unknown	Business size, first rule that applies: startup (incorporated less than 3 years before the segment date), then micro, sme or corporate by the institution's declared size rule (turnover, employees or exposure). Examples of local rules: the EU SME definition (fewer than 250 staff), India's MSME bands, a central bank's SME lending definition. Source: the institution's credit-policy size classification (usually the local regulator's), mapped at onboarding
`sector` frozen at the segment date	ISIC Rev.4 sections A-U, plus unknown	The business customer's main economic activity at the segment date. Source: UN ISIC Rev.4; NACE Rev.2 sections are identical; NAICS and national lists are mapped through published concordances
`sector_l2` frozen at the segment date	ISIC Rev.4 divisions (2 digits, 01-99); each names its section as parent, plus unknown	The same activity at division level, so a shock to one industry (garments = 14, tourism accommodation = 55) can be separated from its section. Source: UN ISIC Rev.4 (or mapped to it)
`employer_sector` frozen at the segment date	ISIC Rev.4 sections A-U, plus unknown, plus unknown	ISIC section of the employer that paid the individual's most recent salary credit before the segment date (public administration is section O). Source: UN ISIC Rev.4
`merchant_sector`	ISIC Rev.4 sections A-U, plus unknown	The merchant's activity, for card spend and acquiring. Source: mapped from the merchant category code (ISO 18245) through a table published with the institution's catalog
`channel`	branch, mobile, internet, atm, agent, contact_centre, api, unknown	The service channel where the transaction or application was made. `api` covers host-to-host and open-banking access; `agent` covers banking agents and correspondents. Source: this spec
`sales_channel`	agency, broker, bancassurance, direct, digital, partner, unknown	How an insurance policy (or a bank-distributed policy) was sold. `partner` covers affinity, retail, telecom and employer schemes; `direct` is the insurer's own staff and branches; `digital` its own web and app sales. Source: this spec
`vehicle_type`	two_wheeler, three_wheeler, car, light_commercial, heavy_commercial, bus, agricultural, other, unknown	Class of the financed or insured vehicle. Source: this spec; map local registration classes at onboarding
`new_used`	new, used, unknown	Whether the vehicle was new (first registration) when financed or first insured. Source: this spec
`cover`	comprehensive, third_party_only, third_party_fire_theft, unknown	Motor cover level. Source: this spec

Dimension	Values	About it
`claim_type`	motor: collision, third_party, theft, natural_peril, glass_other, unknown · health: inpatient, outpatient, day_care, maternity, dental_optical, critical_illness, accident, unknown · travel: medical, trip_cancellation, baggage_delay, other, unknown	What the claim is for; the value set depends on the category. A motor flood claim is claim_type=natural_peril with peril=flood. Source: this spec
`peril`	flood, storm, earthquake, fire, drought, pest_disease, other, unknown	The cause of loss. `storm` covers wind, cyclone, hurricane and typhoon. Source: this spec
`settlement_mode`	cashless, reimbursement, unknown	Health claims: billed directly by the provider (cashless) or claimed back by the insured. Source: this spec
`plan`	institution_defined, plus unknown	Health plan or benefit tier. Source: the insurer's plan tiers, listed in its catalog
`traveller_type`	leisure, business, student, migrant_worker, pilgrimage, other, unknown	Purpose of travel as recorded on the policy. Source: this spec
`tenor_band`	lt_3m, 3m_6m, 6m_12m, 1y_3y, gt_3y, unknown	Contractual tenor at placement or booking. Source: this spec
`rate_type`	fixed, variable, hybrid, unknown	Whether the interest or profit rate is fixed for the life of the contract, resets with a reference rate, or is fixed for an initial period and then resets. Source: this spec
`lc_type`	sight, usance, unknown	Letter of credit payable at sight or deferred (usance, acceptance, deferred payment). Source: this spec
`terms`	collection, open_account, advance, unknown	Import payment terms outside letters of credit: documentary collection (D/P, D/A), open account, or payment in advance. Source: this spec
`withdrawal_reason`	hardship, emigration, housing, medical, education, other, unknown	Reason recorded for an early retirement-plan withdrawal. Source: this spec
`restructure_reason`	income_loss, business_downturn, disaster, other, not_stated, unknown	Reason recorded on a restructure request. Source: this spec
`asset_class`	equity, fixed_income, money_market, mixed, other, unknown	Main asset class of an investment product or fund. Source: this spec
`outflow_type`	at_maturity, premature, unknown	Term-deposit outflow at maturity, or a premature withdrawal (a broken deposit). Source: this spec
`action`	writeoff, restructure, unknown	Write-off, or restructure because of financial difficulty. Source: this spec
`instrument`	cheque, direct_debit, unknown	Payment instrument returned unpaid. Source: this spec
`spend_location`	domestic, cross_border, unknown	Card spend at a merchant in the profile's country or abroad (including foreign e-commerce). Source: this spec
`card_origin`	domestic, foreign, unknown	Acquiring: whether the card was issued in the profile's country or abroad. Source: this spec
`payout_method`	account_credit, cash_pickup, wallet, unknown	How an inward remittance was paid to the beneficiary. Source: this spec
`source`	fc_deposit, export_proceeds, inward_remittance, cash, other, unknown	Where the foreign currency a customer sells to the institution comes from. Source: this spec
`insurance_line`	life, health, general, credit_protection, unknown	Line of an insurance policy distributed by a bank. Source: this spec
`policy_duration_band`	year_1, year_2, years_3_5, years_6_plus, unknown	Policy year at the event date, counted from issue. Source: this spec
`cause_group`	illness, infectious_disease, accident, other, unknown	Cause of death as notified on the claim. Source: this spec; map ICD-10 chapters where coded
`collection_method`	bank_debit, card, payroll, mobile_wallet, airtime, agent_cash, other, unknown	How a premium instalment is collected. Source: this spec
`trade_direction`	import, export, domestic, unknown	Direction of an insured shipment relative to the profile's country. Source: this spec
`commodity_group`	Harmonized System sections I–XXI, plus unknown	Goods shipped, by HS section. Source: WCO Harmonized System
`liability_line`	public, products, professional, employers_workers, directors_officers, other, unknown	Line of liability cover. Source: this spec

Dimension	Values	About it
`crop_group`	cereals, vegetables_melons, fruit_nuts, oilseeds, roots_tubers, beverage_spice, leguminous, sugar, other_crops, livestock, aquaculture, unknown	Insured crop or animal group. Source: FAO Indicative Crop Classification (ICC) groups, plus livestock and aquaculture
`scheme`	public_subsidised, private, unknown	Whether the premium is subsidised under a public scheme. Source: this spec

8. Breaks and events

A **break** is anything other than customer behaviour that changes a metric: a new system, a new product rule, a book bought or sold, a large group scheme joining, a relief scheme, a disaster that closed branches, a redenomination. Declare breaks at `GET /metrics/v1/breaks`. The checks need them to avoid reading your own changes as a market effect.

Two types.

- **Lasting shifts** have a start date and **no `until`**. Comparisons use only spans wholly after the shift; for a seasonal ratio, their year-ago and growth windows must be after it too. A lasting shift inside the window being judged means no verdict, unless the break **is** the event being checked: give it that event's `event_id`.
- **Episodes** have a start and an **`until`** (exclusive). Spans that touch an episode are left out of baselines. A `relief` episode inside the watch masks the credit-quality family (or premium collection, with `relief_kind: premium_grace_extension`) when no trigger metric is served.

Kind	Type	Meaning
`system_migration`	lasting (no until)	a core, card, policy or claims system change that alters how or when records are posted
`product_change`	lasting (no until)	a product launched, withdrawn, repriced structurally, or its terms changed
`rule_change`	lasting (no until)	a regulatory, accounting or tax rule that changes what is recorded (a new dpd counting rule, IFRS 9 or IFRS 17 adoption, a change of weekend)
`portfolio_transfer`	lasting (no until)	a book bought, sold, merged or moved between products or entities
`large_scheme_change`	lasting (no until)	a group scheme, fleet, payroll or corporate relationship larger than 5% of a metric's exposure or volume joining or leaving
`classification_change`	lasting (no until)	a change in how customers, sectors or regions are classified (including branch mergers and ISO 3166-2 code changes)
`definition_change`	lasting (no until)	the institution changed how it computes a spec metric (e.g. a new transaction-code list)
`currency_redenomination`	lasting (no until)	the base currency was redenominated (e.g. SLL to SLE in 2022, at 1,000 to 1); history is restated at the legal factor and the break records the date and factor
`relief`	episode (with until)	a payment moratorium, deferral, premium-grace extension or fee waiver, with its end date; `relief_kind` says which
`disaster`	episode (with until)	a flood, storm, earthquake, epidemic or conflict that disrupted operations or customers
`outage`	episode (with until)	a system or network outage that disrupted transactions
`campaign`	episode (with until)	a one-off promotion large enough to move a metric (recurring campaigns go in the calendar as flags)
`market_disruption`	episode (with until)	a market closure, bank holiday declared at short notice, or capital-control episode

Fields (schema `Break` in the OpenAPI file):

Field	Meaning
`break_id`	your id
`kind`	a kind from the table above
`type`	`lasting` or `episode`
`date`, `until`	local dates
`product_ids`, `metrics`	which products and metrics it affects (empty = all)
`applies_to`	a dimension filter, e.g. `{region_l1: [IN-KL]}` for a regional flood
`relief_kind`	for relief: `credit_moratorium`, `premium_grace_extension` or `fee_waiver`
`factor`	for `currency_redenomination`: old units per new unit
`event_id`	optional: the event this break is, when it's known
`description`	plain words. **Never names a customer, employer or obligor** (R1)
`declared_at`	when you declared it, so late declarations are visible

What to declare, at the least:

- every core, card, policy or claims-system migration of the last 39 months;
- every relief scheme, including farm-loan waivers;
- product launches and withdrawals;
- group schemes, fleets, payrolls or corporate relationships above 5% of a metric's exposure joining or leaving;
- changes to how you compute a spec metric;
- disasters that closed branches or stopped claims handling;
- currency redenominations.

Recurring seasonal events (festivals, salary days, harvests, campaigns that come back every year) go in the **calendar** as flags, not in breaks.

> **Example (Europe).** A German bank migrates its core on 2026-11-16. Standing-order collections move from the due date to T+3. Declared as `system_migration`, lasting, for

> `retail_loan.installment_collection_rate`.

>

> **Example (Africa).** A Kenyan health insurer onboards a 45,000-life employer scheme on 2026-04-01, growing its insured lives by 38%. Declared as `large_scheme_change`, lasting, for `group_health` metrics.

>

> **Example (South Asia).** A flood-relief moratorium is declared from 2026-12-07 to 2027-03-07 for two districts. Declared as `relief`, episode, `relief_kind: credit_moratorium`, with `applies_to: {region_l2: [...]}`.

9. Conformance checks and errors

You can run these checks yourself before onboarding; the connector runs the same ones and reports each as pass, fail or not applicable, with the fix.

Id	Level	Check	Passes when	Fix
C01	L1	**Profile complete.** GET /catalog returns spec_version, time_zone (a valid IANA name), business_calendars (a primary one, and one per region with its own holidays or weekend), base_currency and pivot_currency (ISO 4217), fx_reference_sources, region_basis, accounting_framework with the dpd fields, suppression rule and capability_level.	Every field present and valid.	Fill the profile; use IANA names such as Asia/Dubai, never offsets like +04:00; declare a calendar for every region whose holidays or weekend differ.
C02	L1	**Products mapped.** Every product in the catalog names a category and product type from this spec; every metric key is a spec key or an alias, offered only for categories that define it.	No unknown category, product type or metric key.	Map the product to the nearest type, or report it as unmapped; rename keys or declare the mapping in the connector.
C03	L1	**Grid periods.** Rows for daily, weekly and monthly requests: from < until, until exclusive, weeks start on Monday, months on the 1st, business-day rows only on business days of the calendar that applies (the region's, or the primary calendar for multi-region totals); no gaps or overlaps.	Every row sits on the grid.	Compute periods in the profile's time zone with until exclusive; never return partial periods.
C04	L1	**No relative, off-grid or over-filtered requests.** A request whose start or until is off the metric's grid, that names a relative window, that filters on more than 3 dimensions, or whose segment_as_of is not a Monday, is rejected with the matching error code; the current, still-open period is never returned.	400 off_grid, too_many_filters or segment_date_not_on_grid; no row for an open period.	Validate dates and filters before querying; drop 'last N days' and 'month to date' parameters.
C05	L1	**Units and currency.** unit matches the spec; currency is an ISO 4217 code; currency_basis=original returns metrics whose rule is `original` in the currency the customer paid or was paid in, and base returns the same totals converted at transaction-date rates.	Units equal the spec; original and base differ only by the conversion.	Store the original amount and currency per transaction (for remittances: the sender's instructed currency); convert at the declared reference rate of the transaction's date, not the period end.
C06	L2	**Ratio and rate arithmetic.** For ratios, value = numerator ÷ denominator × 100; for rates, value = numerator ÷ exposure × 1,000; within 0.01 of the unit.	All rows agree.	Return the numerator and denominator the value was computed from, not separately rounded figures.
C07	L2	**Additivity.** For flows and counts: the sum over a breakdown's values (including unknown) equals the unfiltered total, allowing for suppressed cells; daily rows summed over a week equal the weekly total the institution would compute.	Differences only where cells are suppressed.	Use one set of inclusion rules and one booking date for every grain and breakdown; send records without the attribute to `unknown` instead of dropping them.
C08	L2	**Stock consistency.** A weekly or monthly stock equals the daily stock on the period's last business day.	Equal.	Read stocks from the end-of-day snapshot of the last business day.
C09	L2	**Suppression.** No unsuppressed row has fewer distinct contributors than the minimum, breaks the (1, 50%) or (2, 85%) dominance rule on its measured component, or serves a median from fewer than 20 contributors; suppressed rows return null value, numerator, denominator, exposure and volume.	No row breaks the rule.	Apply suppression to every returned aggregate, after filtering, on the requested period, counting customers rather than accounts.
C10	L2	**Complementary suppression over served combinations.** For a sample of suppressed cells, the connector tries to rebuild each one from published cells: parent total minus siblings, across every filter combination the catalog serves (up to 3 dimensions).	No suppressed cell can be rebuilt.	Run secondary suppression over the full set of served combinations (or restrict them with filter_sets).
C11	L3	**History depth.** Each metric's earliest row is at least history_months before the latest closed period (39 for seasonal, recent-vs-prior and trend tests, 27 for level tests), or at the product's declared launch date.	Deep enough, or launch declared.	Back-fill from the system of record, flagging the rows backfilled: true; declare launch dates and any system migration as a break.
C12	L3	**Publication.** Every live (not back-filled) row has published_at; in the last 12 live months, at least 95% of periods were published within max_lag_days of their last day.	Present and on time.	Record the local date each period's value was first produced; if your lag is longer, declare it in the catalog (the checks then wait longer).
C13	L3	**Breaks declared.** GET /breaks returns valid rows (kind, type, date, until for episodes, scope); system migrations, relief periods, large scheme or fleet changes and currency redenominations of the last 39 months are present; descriptions name no customer.	Valid, and none known to be missing.	Declare past migrations, product changes, relief schemes and large portfolio moves; lasting shifts have no until.
C14	L4	**Vintages.** For a period known to have been revised: known_through before its first publication returns it as unpublished; between publication and revision returns the first value; same_age_days returns the value as known that many days after the period ended; rows say vintage, revised and revision_held.	All behave as described.	Keep every published value with the date it was produced, or reconstruct vintages from posting timestamps (entries posted by the date, with value dates in the period).

Id	Level	Check	Passes when	Fix
C15	L2	**Frozen segments and the cohort rule.** A request with segment_as_of returns customer attributes as they were on that date; customers who left before it keep the attribute of their last day; customers who joined after it take their attribute at onboarding; facility limits are held at the earlier of the period's start and the segment date.	All four hold on test customers.	Keep dated history of customer attributes, or weekly snapshots; declare the snapshot frequency in the catalog.
C16	L5	**Change concentration.** GET /change-concentration rejects overlapping, unequal or off-grid windows (windows_invalid) and returns only a band of the top share, never a change value, identifier, rank or amount.	Invalid windows rejected; a band only.	Compute per-contributor changes inside your systems and return only the band.
C17	L1	**Calendars.** Business days, holidays and standard flags (weekend, holidays, salary_day, month_end, season:<name>, dst_change) are available for every declared calendar, from the start of history to 12 months ahead, with moving holidays dated.	Complete, per calendar, with named holidays and seasons.	Serve /calendar per calendar_id, or declare the public calendars and their sources in the profile.
C18	L1	**Limits and speed.** A request for a metric's full history (in pages if needed) completes within 30 seconds; 429 and 503 responses carry Retry-After; a page token keeps the known_through of the first page.	Within limits; pages consistent.	Pre-aggregate per period and breakdown; page by period; pin the vintage in the token.
C19	L1	**No personal data.** No response (series, breaks, catalog notes) contains fields or values that look like account, card or policy numbers, names, national identifiers, or single-customer amounts; dimension values are from the spec or the mapped lists.	Nothing flagged.	Remove the field or text; replace identifiers by spec dimension values.
C20	L1	**Spec-version header and aliases.** Every response carries Metrics-Spec-Version with a version this spec accepts (same MAJOR); the catalog lists the aliases and deprecations the server honours; an alias whose filter conflicts with the request's filter returns alias_filter_conflict.	Header present; aliases listed and enforced.	Add the header from configuration; serve the spec's alias table.
C21	L2	**Booking-date self-test (institution only).** Post test transactions: one at 23:30 local time, one on a regional holiday, one reversed two days later, one own-account transfer, one joint-account transfer from a co-holder, one instalment due on a Sunday and paid on Monday.	23:30 in that local day; regional-holiday flow on the region's next business day; reversal netted to the original date; own-account and co-holder transfers excluded; the Sunday instalment counted as collected.	Use local dates of the value date; apply each region's calendar; net reversals to the original date; treat joint accounts as the co-holders' own accounts; measure collections with the clearing days of R4.
C22	L4	**Revision and segment-date guards.** A revision resting on fewer than min_contributors contributors is held (revision_held: true) until it passes or reaches the stable age; a segment_as_of whose membership difference from the previous Monday is between 1 and min_contributors - 1 is refused for that cell.	Both guards fire on test data.	Compare each new vintage and each segment date with the last served one before releasing it.

Error codes

Errors are RFC 9457 problem details with a `code`; each code always comes with the same HTTP status.

HTTP status	Codes
400	`off_grid`, `relative_window`, `range_too_large`, `invalid_parameter`, `too_many_filters`, `segment_date_not_on_grid`, `windows_invalid`, `alias_filter_conflict`, `known_through_in_future`, `unsupported_version`
401	`unauthorized`
403	`forbidden`
404	`unknown_product`, `unknown_metric`
422	`unknown_breakdown`, `value_not_allowed`, `filter_set_not_allowed`, `unsupported_capability`
429	`rate_limited`
500	`internal`
501	`not_implemented`
503	`unavailable`

10. Open points and assumptions

Open points

1. **Region basis.** Banks may choose home branch or customer domicile (domicile is required without branches), so two banks' regional numbers aren't strictly comparable. The checks only compare an institution with itself, so v1.0 allows both.
2. **Claims by loss date.** Frequency uses the reported date, compared at the same age. Loss-date counts with development factors (the actuarial standard) are deferred.
3. **Segment precedence.** One value per customer means a salaried customer who also receives remittances is only `remittance_linked`. Flag dimensions would allow overlaps, at the cost of more suppression.
4. **Cost indices.** Procedure and parts baskets are chosen by each insurer. They are comparable over time within an insurer, not across insurers.
5. **Multi-time-zone countries** (the US, Brazil, Indonesia, Australia). v1.0 assumes one time zone per profile (normally the head office's), with every transaction dated in it.
6. **Fund returns** come from public prices. They could become reference data supplied by the checks rather than an institution metric.
7. **Still missing:** a treasury and ALM view; mortgage collateral value (house-price LTV); unit-linked and annuity flows for insurers; fee-cap effects on payments; a trust signal for insurers.
8. **The clearing window** (3 business days) is a convention chosen to absorb weekend and holiday due dates. Placebo runs may show a shorter window is enough.
9. **The high-inflation threshold** (25% a year, or IAS 29) is a judgement. It only switches the checks to real terms; institutions always serve nominal amounts.
10. **Micro insurance** is defined by the local rule, or by a declared sum-insured ceiling where none exists. A neutral default ceiling hasn't been chosen.

Assumptions

- The checks run inside the institution, and only verdicts and the aggregates behind them leave it. Suppression still applies inside, because model prompts, briefs and operators see the aggregates.
- The (1, 50%) and (2, 85%) dominance rules, the 10-contributor minimum and the 3-dimension filter limit are acceptable to most supervisors. Stricter local rules are honoured.
- Institutions can keep dated history of customer attributes, or at least weekly snapshots, and can reconstruct vintages from posting dates.
- Rival rates, gold prices, FX reference rates, CPI, building-material prices and system-wide cheque-return rates are public. The checking system collects them, not the institution.
- Validation thresholds are starting points. Placebo runs on each institution's history replace them before alerts reach bankers.

11. Event themes each category helps check

The checking system tests hypotheses raised by twelve kinds of event (the themes in the YAML's `vocabularies.themes`). This matrix shows, per category, the metrics that help check each kind. ° marks context, book-size or mask metrics (shown next to verdicts, never tested).

Category	fx	rates
`savings`	balance inward_remittance_credits	deposit_inflow withdrawals large_depositor
`wealth`		investment_subscriptions investment_redempti
`gold_loan`	loans_above_ltv_limit	offered_rate°
`retail_loan`	roll_rate_to_30	installment_collection_rate roll_rate_to_30
`vehicle_finance`	new_leases	installment_collection_rate roll_rate_to_30
`cards`	card_spend_cross_border	card_spend card_payment_rate revolving_
`business_loan`	facility_utilization installment_collection_rate roll_rate_to_30 returned_cheque_rate	facility_utilization installment_collection_rate<b
`agri_loan`		disbursements
`trade_finance`	lc_openings import_bills export_receipts	
`payments`		
`remittances`	inward_remittances outward_remittances	
`fx`	customer_fx_purchases customer_fx_sales	
`distribution`		bancassurance_new_premium
`life`		premium_collection_rate new_policies laps
`health`	procedure_cost_index median_claim_cost°	
`motor`	parts_cost_index median_claim_cost° new_policies	
`travel`	new_policies median_claim_cost°	
`property`	median_claim_cost°	
`marine`	insured_shipments	
`liability`		
`agriculture`		
`micro_insurance`		
`insurer_company`	reinsurance_cost°	solvency_ratio°

Why cells are empty.

- **`markets`** only fills `wealth`, `life` (surrenders) and `insurer_company`. Equity and bond moves reach customers through investment values and savings policies. Deposit flows after a market fall are checked under `trust` and `rates`.
- **`commodities`** fills where a commodity is the product or the trade (gold loans, agricultural lending, trade finance, FX, marine cargo, crop insurance), plus deposits through `segment=government` in commodity-exporting economies. Elsewhere a commodity shock reaches customers through `prices` (fuel, food).
- **`remittance`** fills deposits, remittances, FX, gold loans, retail credit (remittance-linked borrowers), travel (migrant workers), and life and micro premiums. Business lending, agricultural lending and general-insurance lines have no remittance channel worth testing.
- **`trust`** is about the institution or the system. It fills deposits, payments and cash, remittances, FX, investments, life surrenders and card fraud, where customers can move money quickly. Credit books don't react to trust news within the checks' windows.
- **`competitor`** is empty for vehicle finance, business and agricultural lending, trade finance, FX, travel, marine and agriculture. Their pricing is negotiated, bundled or set by public schemes, so there is no public rival price to react to within the checks' windows.
- **`rates`** is empty for trade finance, payments, remittances, FX and general insurance. Their volumes don't depend on interest rates within months.
- **`prices`** is empty for trade finance, remittances, FX, distribution and the commercial insurance lines. Consumer prices act there only through `macro` or `sector`.
- **`fx`** is empty for investments, agricultural lending, payments, distribution, life, liability, agriculture and micro insurance. They are priced and paid in the base currency.
- **`sector`** fills business-facing categories, cards (merchant sector), and wherever employer sector is a breakdown. Retail insurance lines have no sector attribute.
- **`disaster`** is empty for investments, FX, distribution and liability (whose claims metric was cut as too rare to test).
- **`regulation`** is empty for gold loans and payments: there is no tested rule-change mechanism there yet; fee caps are open point 7.
- **`macro`** is empty for agricultural lending (driven by weather and crop prices, under `commodities` and `disaster`) and for `insurer_company`, which is context by design.

12. Counts

- **Categories:** 23 (13 bank, 10 insurer).
- **Metric rows** (a key counted once per category that defines it): 128, over 76 distinct keys. 86 are tested; the rest are context, book size or mask metrics. Derived (computed by the checks, not served): 1.
- **Starter set:** 9 bank and 5 insurer metrics (★ in §5).

Tier	Banks	Insurers	Total
required	34	23	57
recommended	35	18	53
optional	14	4	18
all	83	45	128

Required metrics per category: `savings` 3, `wealth` 4, `gold_loan` 3, `retail_loan` 3, `vehicle_finance` 3, `cards` 3, `business_loan` 3, `agri_loan` 3, `trade_finance` 3, `payments` 2, `remittances` 1, `fx` 2, `distribution` 1, `life` 3, `health` 3, `motor` 3, `travel` 2, `property` 2, `marine` 2, `liability` 2, `agriculture` 3, `micro_insurance` 3, `insurer_company` 0.

13. Common misreadings

The definitions that are easiest to get wrong, and what the spec means.

#	Metric	Easy to get wrong	What the spec means
1	`segment` = `student`	Keeping graduates in the segment until their product is converted	Only customers holding a student product on the segment date
2	`installment_collection_rate`	Using the loan system's allocation (oldest arrears first), which understates collections for borrowers in arrears	Apply each payment to the period's instalment before older arrears, and count receipts up to the 3rd business day after the due date
3	`facility_utilization`	Switching between a "shadow" limit and the recorded limit of an uncommitted overdraft	One recorded limit per line, held at the earlier of the period's start and the segment date
4	`large_depositor_net_flow`	Ranking accounts, or connected groups, instead of customers	Rank customers by total deposits on the first day of the month; the group holds 20% of deposits, at least 30 customers
5	`procedure_cost_index`, `parts_cost_index`	Serving the average claim cost under the index's name	A fixed, declared basket of items priced each month, weights fixed for a year
6	`claims_per_1000`	Counting a three-day storm as three events, or a multi-vehicle collision as one claim; counting bills or pre-authorisations	One claim per insured risk (vehicle, location, life) per loss event; exposure counts risks, not policies
7	`customer_fx_purchases`, `customer_fx_sales`	Leaving card-scheme or remittance FX inside because it is booked as deal tickets	By transaction code: customer FX deals and account conversions only; anything settled through a card scheme or remittance network is out
8	`offered_rate`	Serving an average of rates actually paid, or changing the reference tenor silently	The advertised standard (or announced expected profit) rate for the declared reference tenor; a tenor change is a `product_change` break
9	`lapse_rate`	Counting policies still in grace as lapsed; leaving unit-linked discontinuances out	Lapse date = end of grace; count policies not reinstated within 90 days; map discontinuances to lapses
10	`card_fraud_rate`	Counting merchant disputes as fraud	Purchases reported or detected as fraud, by transaction date; disputes that aren't fraud are out
11	`roll_rate_to_30`, `dpd_30_plus`	Using 30 days or more, or resetting dpd when a loan is restructured	More than 30 days (31+); dpd keeps counting through a restructure
12	`inward_remittances`	Serving the settlement currency (often USD) instead of the sender's currency	The sender's instructed currency from the payment message

Change log

Version	Date	Change	What changed
1.0.0	2026-10-11	MAJOR	First release, for implementation feedback: 23 product categories, the reference API, the conformance checks C01 to C22 and the validation parameters 1.0.0.

No aliases or deprecations in this version.
